After two years have elapsed from this declaration, if he has resided five years in the United States, he becomes a citizen, and a certificate of naturalization is issued to him. It was formerly held by the British government that none of its citizens could thus renounce their allegiance, but this claim has been given up, and British subjects naturalized in the United States are now recognized as American citizens. Air is condensed in a reservoir at the surface to a degree somewhat

greater than the condensation due to the depth, and passes through a pipe into the chambers rendering the machine specifically lighter than water, and enabling it to lift stones or other objects below. A gauge indicates the amount of lifting power attained as the air is admitted, so that the supply may be cut off when the requisite power is reached.

1. The act of navigating; passing from place to place in ships; sailing.

2. The art or science of navigating or conducting vessels from one port to another, on the ocean, by the best routes. Navigation more especially means the art of directing and measuring the course of ships, and of determining the position of the ship at any moment, and the direction and distance of her destination. The management of the sails, steering, and the general working of the vessel belong rather to seamanship (q.v.). There are two methods of determining the position of a ship at sea: the first is by means of the reckoning; that is, from a record which is kept of the courses sailed and distances made on each course [Dead-reckoning]; the second is by means of observations made on the heavenly bodies, and the aid of spherical trigonometry. The first method gives only approximate results; the second admits of great accuracy. The position of the vessel being known at any moment, the direction and distance of any other point may be determined either by the aid of a chart, or by the application of the principles of trigonometry. To the approximate methods of determining a ship's position it is necessary to add frequent checks by astronomical observations. The principal objects to be attained by astronomical observations are, to ascertain the latitude, the longitude, and the variation of the needle, for correcting the dead reckoning.

navigation-laws, *s. pl.*

Polit. Econ. & Hist.: The branch of maritime law which comprises the various Acts

which have been passed in relation to ships and the way in which they are to be manned, the peculiar privileges which they enjoy or enjoyed, and the conditions on which foreign vessels may be allowed to import or export home produce, or engage in the coasting-trade. The first maritime code in England seems to have been that of Oléron [OLERON]. Other enactments followed in the reign of Richard II. Those in the reign of Henry VII. to a considerable extent anticipated the Legislation as to Foreign Trade of the Long Parliament. By 5 Eliz., c. 5, foreign ships were excluded from English fisheries and the coasting-trade. By the Act of Navigation, passed by the Republican Parliament on Oct. 9, 1651, no goods of any kind were to be imported into England or the Colonies except in ships owned and manned by Englishmen. These restrictive laws have since been gradually abrogated, and the special protection of British ships against foreign competition no longer exists. In the United States the coasting-trade is reserved exclusively to American vessels. After the establishment of independence in the United States, a retaliatory policy was instituted against Great Britain, whose navigation laws were still protective, and acts were passed discriminating so greatly in favor of American shipping that it gained a monopoly of the foreign carrying trade. In 1815 a treaty was negotiated between the United States and Great Britain by which this policy was relaxed, and the restriction greatly reduced. At present, as above stated, it is confined to the coasting-trade.

"There's enough of me to make a good *navigator* if all trades fail."—*C. Kingsley: Yeast*, ch. xi.

nā'-vy, * **nā'-vie,** *s.* [O. Fr. *navie* = a ship, a navy, from Lat. *navia* = a ship, a vessel; *navis* = a ship; Gr. ναῦς (*naus*); Sansc. *nau* = a ship, a boat; A.S. *nacu* = a boat; Icel. *nökkvi*; Ger. *nachen.* From the same root as Lat. *no* = to swim; Gr. νάω (*naō*) = to flow.]

* 1. A fleet.

2. The shipping of a country collectively.

"None but wood ships were built, either for the war *navies* or the merchant *navies* of the world."—*Brit. Quart. Review*, 1873, p. 89.

2. The war-ships belonging to a country collectively; the naval establishment of a country, including the ships, officers, men, armaments, stores, &c., intended for use in war. Previously to 1840 the ships of the line of the British navy were all sailing vessels; in 1841 steam began to be substituted for sails. As early as 1840 the building of ironclad vessels had been suggested to the United States Government by Mr. Stephens, of New York, and it was in that country that the earliest seagoing ironclad cruisers were built. [IRONCLAD, A.] The first of these to be used in a naval conflict were the Monitor and Merrimac, whose memorable battle in Hampton Roads, during the Civil War, attracted the attention of the world, and set all the nations of Europe busily at work building iron-clad war vessels. Since that period numerous great war ships, heavily coated with iron or steel, have been built in the navy-yards of the various nations of Europe. In the United States, however, the iron-clad vessels of the war were laid away in useless retirement, and nothing was done to replace the wooden vessels in commission until about ten years ago, when the building of a fleet of iron-clads begun, and has been pushed diligently from that time to the present. To-day this country possesses a strong fleet of armored vessels, cruisers, coast defense war-ships, and others, armed with the most effective guns yet devised, and the latest of them plated with a specially hardened steel that is almost or quite impenetrable to any projectile yet invented. The speed of the cruisers is equal to that of the fastest passenger steamers, and in case of war no mercantile vessel could escape them. The work of building is still actively pursued, and by the end of the century this country will probably have a fleet of iron-clads equal in effectiveness to that of any nation in Europe. In 1892 the armored ships possessed by the various nations was as follows: Great Britain, 80; France, 59; Russia, 38; Netherlands, 24; Italy, 20; Germany, 19; Spain, 13; Austria, 12; Turkey, 14; Sweden and Norway, 9; Denmark, 7; China, 7. The United States had at that time 14 partly or fully completed. The numbers of these vessels, however, does not indicate their force as engines of war, there being a great difference in their size and armament. Thus France has 694 guns to Great Britain's 616, Italy's 288, and Russia's 142, the calibre of these guns differing as greatly as does the size and strength of the vessels upon which they are mounted. The Harveyized nickel-steel plate, above alluded to, is being used on all our new armor-plated vessels, and may in the future be used in gun construction. Experiments with armor-piercing projectiles are still being prosecuted, and the American dynamite gun promises to be a highly destructive weapon in future wars.

Jerome (*Ep.* 79) says: "Desiring to be both Jews and Christians, they are neither the one nor the other." The hair was allowed to grow, the fruit of the vine in any shape was forbidden, and no Nazarite might approach a corpse. The "law of the Nazarite" is given at length in Numbers (vi. 1-21). Samson (Judges xiii. 5), Samuel (1 Sam. i. 11), and John the Baptist (Luke i. 15) were Nazarites. From Amos (ii. 11, 12) it may be gathered that persons so dedicated to God had an organization like that of the prophets, and among the later Jews the vow was developed (1 Mac. iii. 49; Acts xviii. 18, xxi. 23, 24). 1. *Astron.*: A slight cloudy patch of light, retaining its form unchanged except under keen and long-continued observation. More than five thousand nebulæ, or star-clusters closely resembling them, have been found in both hemispheres, and in nearly every constellation. A few, as the great nebulæ of Orion, Argo Navis, and Andromeda, are visible on very clear nights to the naked eye; the rest are telescopic. When greatly magnified some are found to be composed of many thousand remote stars, others remain only as diffused masses of light. Sir William Herschel divided them into six classes:

(1) Clusters of stars, globular or irregular in form.
(2) Resolvable nebulæ, which look as if they might be resolved into stars under powerful telescopes.
(3) Nebulæ which look quite irresolvable.
(4) Planetary nebulæ, circular or slightly oval, like a planetary disk, and often coloured.
(5) Stellar nebulæ, *i.e.*, those having in their middle a condensation of light.
(6) Nebulous stars (q.v.).

The great nebula of Orion surrounds a multiple star, θ Orionis, consisting of six, apparently revolving round their common centre of gravity. It has been found to alter its form very slightly. The late Earl of Rosse

and his assistant, Mr. Storey, detected in its densest part multitudes of minute stars, but the bluish light of parts of it has remained irresolvable, and Dr. Huggins has ascertained by means of spectrum analysis that this portion of it is a gaseous body, containing hydrogen, nitrogen, and an unidentified substance. The nebula in Andromeda is different, and may perhaps be wholly resolved into stars.

nebular-hypothesis, *s.*

Astron.: An hypothesis first suggested by Sir William Herschel in a paper read before the Royal Society, on June 20, 1811, though the germs of it may be found in Kant's *General Natural History and Theory of the Heavens*, printed in 1755. It was developed by La Place, with whose name it came to be associated. The hypothesis assumes that originally all suns were in a nebulous or ultra-gaseous state. The nebulous matter from which they were originally formed was at first scattered pretty uniformly through all space, but ultimately began to gravitate towards certain centres. The particles moving towards these centres not doing so with equal velocities or in the same direction, rotation would be established in the entire nebulous mass, and the spherical form produced. If, by radiation of heat, the condensed body still further contracted, its velocity would increase. If the centrifugal force overcame that of gravity, a ring would be thrown off, which would gradually become globular, in fact it would be a planet with an orbit almost or quite circular, moving in a plane nearly that of the central body's equator and revolving in its orbit in the same direction in which the central globe rotated. Further contraction producing increased velocity, ring after ring would be cast off, till the central body or sun generated a whole system of planets revolving around it. They, in turn, might in the same way produce satellites. Laplace believed that the sun thus produced our earth and the other attendant planets. On this hypothesis, the rings of Saturn were produced by Saturn himself, and have remained in the annular form instead of condensing into nearly spherical satellites. Many people supposed that the resolution of various nebulæ into stars [NEBULA] was necessarily fatal to the nebular-hypothesis, but the discovery that some are not only irresolvable, but can be actually proved by spectrum analysis to consist of glowing gas, has re-established it upon a firmer basis than ever, though the original theory may need revision in points of detail.

Of this nature is the obligation of civil subjection, whereby the inferior is constrained by the superior to act contrary to what his own reason would suggest, as when a legislature establishes iniquity by a law, and commands the subject to do an act contrary to morality.

"Another species of compulsion or *necessity* is what our law calls *duress per minas*; or threats and menaces, which induce a fear of death or other bodily harm, and which take away, for that reasou, the guilt of many crimes and misdemeanors. There is a third species of *necessity*, viz., when a man has his choice of two evils, and being under a *necessity* of choosing one, he chooses the least pernicious of the two. Where, for instance, a man, by the commandment of the law, is hound to arrest another for auy capital offence, or to disperse a riot, and resistance is made to his authority: it is here justifiable and even uecessary to wound or perhaps to kill the offenders, rather than permit the murderer to escape, or the riot to continue."—*Blackstone: Comment.*, bk. iv., ch. 2.

Anthrop.: The distiuctly dark, as opposed to the fair, yellow, and brown varieties of mankind. Their original home was probably all Africa south of the Sahara, India south of the Indo-Gangetic plains, Malaysia, and the greater part of Australasia. In early and middle Tertiary times this tract was probably broken up by the sea, and the disappearaucc of the region named by Sclater Lemuria. Negroes fall naturally into two great divisions: (1) African Negroes, (2) Papuans or Melanesians. Prof. A. H. Keane (*Encyc. Brit.*, ed. 9th, xvii. 316–320) makes four sub-divisions of African Negroes, according to locality: (1) West Soudan and Guinea; (2) Ceutral Soudan and Chad Basin; (3) East Soudan and Upper Nile; (4) South Africa. Ile estimates their number at 130,000,000, with probably 20,000,000 full-blood or half-caste negroes, either slaves or descendants of slaves, chiefly in tropical or sub-tropical America, and enumerates the following as the chief anatomical and physiological points in which the Negro differs most from his own congeners:

1. The abnormal length of the arm, sometimes reaching to the knee-pan.
2. Prognathism (Facial angle 70°, in Caucasian 82°).
3. Weight of brain, 35 oz. (in gorilla 20 oz., average European, 45 oz.).
4. Full black eye, black iris, and yellowish sclerotic coat.

10. Complexiou deep brown, blackish, or eveu black, not due to any special pigment, but to the greater abundance of colouring matter in the Malpighian mucous membrane.
11. Short, black hair, distinctly woolly, not frizzly.
12. Thick epidermis, cool, soft, and velvety, mostly hairless, and emitting a peculiar odour, described by Pruner Bey as hircine.
13. Frame of medium height, thrown somewhat out of the perpendicular by the shape of the pelvis, the spine, the backward projection of the head, and the whole anatomical structure.

Scrip. Biography: Three persons of this name are mentioned in Scripture: one who came with Zerubbabel from Babylon (Ezra ii. 2; Neh. vii. 7); another, the son of Azbuk (Neh. iii. 16); and lastly the celebrated Jewish leader, the son of Hachaliah (Neh. i. 1), and brother of Hanani (i. 2, vii. 2). In the twentieth year of the reign of Artaxerxes Longimanus, king or emperor of Persia (B.C. 445), he was cupbearer to the monarch. Questioned as to why he looked sad, he replied that his sorrow arose from the reflection that the city (Jerusalem), the place of his ancestors' sepulchres, lay waste, with its gates burnt (Neh. ii. 3). He requested permission to rebuild the city, and was allowed temporary leave of absence to carry out the project. Carrying with him letters from the king designed to secure co-operation from various quarters, he proceeded to Jerusalem, obtained zealous assistance from his countrymen, and, notwithstanding Samaritan and other opposition, rebuilt the wall. An inscription in the earliest Hebrew, discovered in 1880 in the tunnel cut through the rocks which conducts the water of the Virgin's Spring, the Gihon of Scripture, into the modern pool of Siloam, has, in Prof. Sayce's opinion, become the starting point for comprehending the topography of Jerusalem in the times of the Kings and in that of Nehemiah. Mount Zion is now fixed as the hill on the south-western slope of which is the Pool of Siloam. The valley of the Tyropœon of the Græco-Roman age, was the Valley of Hinnom. The size of Jerusalem was only fifty acres, but it had crowded into it a population of 15,000 Jews and 5,000 slaves. In 433 B.C. Nehemiah returned to Persia, but that year or the next was a second time appointed Governor of Judæa. The date of his death is unknown. (*Sayce: Introd. to Ezra, Nehemiah, & Esther.*)

¶ *The Book of Nehemiah:*

Old Test. Canon: In modern Hebrew Bibles, as that of Van der Hooght, the Book of Nehemiah is distinct from that of Ezra, immediately following it as one of the Hagiographia. In the Jewish Canon, however, the two were treated as a single work. Origen was the first to separate them, calling them the first and second books of Esdras. Jerome applied to the second the name of Nehemiah. The style of the two is so different that they must have had different authors. The latter work is naturally divided into four portions: ch. i.–vii., a continuous narrative written by Nehemiah; ch. viii.–x., apparently from another author; ch. xi.–xii. 26, from Nehemiah's pen, as was the fourth section, xii. 27 to end of the book, excepting some verses of later date. Nehemiah's portions of the book were of date 433–2 B.C.; the later verses, which refer to Jaddua, high priest in the time of Alexander the Great and Darius Codomannus, B.C. 336–331, were penned later than this date (ch. xii. 11-22). The language used is Hebrew with some Aramæisms. Persian words also occur, some of which, however, are now found to have been originally Babylonian. No quotation from the book occurs in the New Testament. The Septuagint translation of the book is badly executed. (*Sayce: Introd. to Ezra, Nehemiah, & Esther.*)

Hist. & Philos.: The name given to an important movement in the Alexandrian school. G. H. Lewes says that their originality consisted in having employed the Platonic Dialectics as a guide to Mysticism and Pantheism; in having connected the doctrine of the East with the dialectics of the Greeks; in having made Reason the justification of faith; and he concludes that "by their Dialectics they were Platonists; by their theory of the Trinity they were Mystics; by their principle of Emanation they were Pantheists." Neoplatonism passed through three periods: (1) that of Ammonius Saccas and Plotinus, in the third century [AMMONIAN, (2)]; (2) that of Porphyry and Iamblichus, in the fourth century; and (3) that of Proclus (412–485). Under Justinian (483–565) the Alexandrian school became extinct.

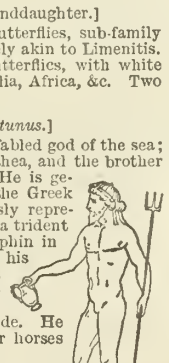
He was said to preside over horses and the manger.



NEPTUNE.

2. *Astron.:* A planet, the most remote of any yet discovered. Irregularities having been remarked in the movements of the planet Uranus, not to be accounted for by the attraction of any known heavenly body, two astronomers, M. Leverrier in France, and Mr. Adams in England, correctly reasoning that the perturbations must proceed from a yet undiscovered planet, independently calculated the probable place in the sky which such a planet would occupy. On September 20, 1846, Leverrier's calculations were communicated to Dr. Galle of Berlin, who promptly looked on the heavens, and the very same evening discovered the planet afterwards named Neptune within a single degree of its calculated position. Adams's computations had been placed in the hands of the Astronomer Royal, Sir George Airy, in October, 1845. Not, however, till July 29, 1846, did Prof. Challis, of Cambridge, at the Astronomer Royal's suggestion, commence a search of the heavens for the planet, but not having the same fine star-chart which Dr. Galle possessed at Berlin, he found the planet without recognising it as one on July 30, as Lalande had done on May 10, 1795, and Dr. Lamont in 1845 and 1846. The diameter of Neptune is nearly 35,000 miles. Its density is only a fifth that of the earth, its mean distance from the sun 2,780,000,000 miles, and its year 155 times as long as one of ours. Mr. Lassell discovered that it has one satellite.

Neptunian Theory or *Hypothesis:*

Geol.: An hypothesis devised by Werner (1750–1817) to account for the aspect of geological strata. He assumed that the globe had at first been invested by a universal chaotic ocean, holding in solution the materials of all rocks. From these the crystalline rocks were first precipitated, somewhat clearing the waters, after which the so-called transition rocks went down next. The secondary rocks then followed. All igneous agency was ignored in this scheme. The Neptunian hypothesis has been long since disproved. [AQUEOUS ROCKS, GEOLOGY.]

(*Carpenter.*)

areolar web. They are also connected with ganglia, which are of a pearly-gray tint, and which form the sympathetic system. The capillary vessels of nerves are very minute, and by their transverse communications form an oblong mesh similar to that of the muscular system.

(2) *Compar.:* In the lowest divisions of the animal kingdom no distinct nerve-system has been traced, but in Radiata, Star-fish, *e.g.* we find nerves arranged in a circle round the mouth, communicating with the ganglia, one of which is found at the base of each ray. The simplest form, however, is found in the Mollusca. Coming to insects, we find they possess nerve-structure producing sensory, reflex, and motor action, and as we rise in the scale, the resemblance to that of man increases. [BRAIN.] There is a strong analogy between nervous action and electricity (q.v.).

(1) Properly, the place chosen or constructed by a bird for incubation and rearing its young. These are extremely diversified in situation and character. Some auks lay their eggs on the bare rock, the stone-curlew and the goat-sucker on the ground; the apteryx chooses the root of a tree-fern; the peculiar nidification of the ostrich was noticed by the author of the Book of Job (xxxix. 13, 14); the sheld-duck and martin line their habitations with down; the kingfisher makes a couch of undigested fish-bones ejected from the stomach in its tunnel; the woodpecker selects a hole in a tree; the megapodes, and in a less degree, the grebes and rails, utilize the heat of decaying vegetable matter; the edible nests of *Collocalia esculenta* are the product of salivary secretion; the tailor-bird spins a thread and stitches its habitation together; golden-wrens and orioles have hammock-like constructions; the grosbeaks and humming-birds build a chamber depending from a single thread; the flamingo raises a high mound to receive the eggs, and the hen sits astride on the top; the hornbills are incarcerated during incubation, the males bringing them food; and the sociable grosbeaks form colonies so large that the weight of the nests has been known to break down the limbs of trees. (The subject has an extremely limited literature, but an excellent paper will be found in Wallace's *Contributions to the Theory of Natural Selection.*)

Nĕs-tŏr'-ĭ-ăn-ĭsm, *s.* [Eng. *Nestorian; -ism.*]

Church Hist.: The doctrine taught by Nestorius, Bishop of Constantinople, and one of the school of Theodore of Mopsuestia, that there were two persons as well as two natures in Jesus Christ and that the Virgin Mary was in no sense Theotokos, or Mother of God, as she was the mother of the man Jesus and not of the Word. This doctrine was condemned by the Council of Ephesus, convened by Pope Celestine I., in A.D. 431. Nestorius was deposed, and the use of the Nicene Creed made obligatory. Nestorianism made rapid strides in the east, and Cardinal Newman (*Arians*, p. 425) says that in the eleventh century "its numbers, with those of the Monophysites, are said to have surpassed those of the Greek and Latin Churches together." Since 1553 a portion of the Nestorians have been in communion with Rome, and are known as Chaldeans. Blunt was of opinion that Nestorius did not hold the doctrine of a dual nature, but that his chief offence in the eyes of the orthodox was opposition to the growing devotion to the Virgin Mary.

Nicene-councils, *s. pl.*

Church Hist.: Two councils held at Nicæa; the first in 325 under Pope Silvester I. on account of the Arian heresy. It drew up the Nicene Creed, and settled the controversy as to the keeping of Easter. [Quartodeciman.] The second in 787, under Pope Adrian I., was convened to put an end to the Iconoclastic controversy. Both are considered œcumenical by the Roman Church. The Anglican Church only admits the authority of the first.

Nicene-creed, *s.*

Ritual & Church Hist.: Properly the Constantinopolitan-Nicene Creed. It was formulated by the first council of Nice, and the "Filioque" clause, to which the Greeks objected, was added at the First Council of Constantinople, A.D. 381, under Pope Damasus I. The Creed is recited daily in the Roman Mass—all present genuflecting at the words "Et homo factus est"—and in the Communion office of the Anglican Church.

1. *Lit. & Arch.*: A cavity or hollow place in the thickness of a wall, in which to place a figure, a statue, a vase, or an ornament. Niches are made to partake of all the segments under a semicircle. They are sometimes at an equal distance from the front, and parallel or square on the back with the front line, in which case they are called square recesses or square niches. Occasionally small pediments were formed over them, supported on consoles, or small columns or pilasters placed at the sides of the niches. Anciently they were used in ecclesiastical buildings for statues and shallow square recesses. Semicircular niches for the reception of statues were of frequent occurrence in the walls; and there was generally a large niche, with a vault above it, facing the entrance of the temple, and forming the termination of the buildiug, which contained the image of a god. In the Early English architecture niches became more deeply recessed. In the Decorated style greater variation was introduced; in plan, they cousisted of a half-octagon or half-hexagon, the heads were formed into groiued vaults, with ribs, bosses, pendants, and canopies elaborately carved and ornamented. They were projected on corbels and ornamented with pillars, buttresses, and mouldings of various kinds.

1. *Chem.*: Symbol, Ni; atomic weight, 58·7. A tetrad-metallic element, discovered by Cronstedt in 1751, in conbination with arsenic, in the copper-coloured mineral arsenide of nickel; called by the miners kupfernickel. Its preparation is effected in various ways, the methods involving first the separation of the arsenic, copper, &c., with hydric-sulphide, and that of cobalt by chloride of lime or nitrite of potash. The solution of pure nickel is precipitated by potash, and the dry oxide mixed with oil or charcoal and exposed in a crucible to the heat of a blast-furnace, whereby the metal is obtained as a fused mass. Nickel is silver-white, malleable and ductile, and as infusible as iron. Specific gravity, 8·28 to 8·66. It is magnetic at ordinary temperatures and dissolves iu dilute-sulphuric, nitric, and hydrochloric acids. Nickel forms several alloys, the most important being known as German-silver. It forms two oxides: Nickel protoxide, NiO, formed by exposing nitrate of nickel to continued ignition; it is a grayish-green non-magnetic powder, which does not absorb oxygeu from the air; Nickel sesquioxide, Ni_2O_3, formed by exposing nitrate of nickel to a moderate heat; it is a black powder, which dissolves in acids with evolution of oxygen and formation of nickel salts. These are mostly emerald-green in the hydrated state, turning yellow when heated.

nickel-plating, *s.*

Chem.: The art of coating copper, brass, or other metal with nickel. To a dilute solution of pure ziuc chloride a solution of nickel sulphate is added, until the liquid is distinctly green, and the whole raised to the boiling-poiut. The article to be plated, after being thoroughly cleaned, is placed in the liquid, and the boiling continued for thirty minutes, when the nickel will be found deposited in a brilliant white layer. After being washed and dried it takes a fiue yellowish-toned polish. A moderate battery power and nickel anodes are sometimes employed. Nickel electrotypes stand wear and tear much better than the ordiuary copper ones.

Optics: An instrument for polarising light. It is formed from a rhombohedron of Iceland spar, thrice as long as its diameter, which is bisected in the plane which passes through the obtuse angle. The new faces being polished, the two halves are again united by Canada balsam. When a luminous ray enters the prism the ordinary ray undergoes total reflection at the layer of balsam, and is reflected out of the crystal, while the extraordinary one is alone polarised. It is thus a most valuable polariscr. Modifications of this prism have been made by Foucault, who substitutes for the balsam a layer of air; by Prazmowski, who cuts the spar differently, and cements the two halves together with linseed-oil; by Dr. Steeg, Mr. Glazebrook, Professor Thompson, Dr. Feussner, and others.

B. *As substantive:*

Church Hist. (*Pl.*): An heretical sect mentioned in the Revelation (ii. 6, 14), and there charged with disregarding the injunction laid by Peter, James, and Paul upon the Gentile converts (Acts xv. 20). In all probability the impurity forbidden was looked upon as an act of religious worship, such as in early Jewish times had been borrowed from pagan nations (2 Kings xxiii. 6, 7; 2 Chron. xxi. 11; cf. Baruch iv. 43), notably from the Babylonians, whose worship of Mylitta is described by Herodotus (i. 199). Hosea (iv. 12–14) trenchantly denounces such practices. The Nicolaïtanes are said to have been founded by Nicolas the Deacon, but the evidence is not convincing.

nĭc'-ŏ-tĭne, *s.* [Eng., &c. *nicot(iana)*; *-ine* (*Chem.*).]

Chem.: $C_{10}H_{14}N_2$. An acrid poisonous alkaloid found in tobacco leaves to the extent of from 1 to 5 per cent. It may be prepared by passing a current of steam through a mixture of lime and powdered tobacco, neutralising the liquid which comes over with sulphuric acid, adding ammonia to liberate the nicotine, and dissolving the latter in ether. The etherial solution yields almost pure nicotine. It is a colourless transparent oil, which boils at 250°, and does not freeze at—10°. Specific gravity, 1·027 at 15°. It has a strongly alkaline re-action, and turns the plane of polarisation to the left. Soluble in water, alcohol, ether, and the fat oils, and its characteristic re-action is the formation of a kermes-brown precipitate with tincture of iodine. Nicotine forms numerous salts. The sulphate $(C_{10}H_{14}N_2)_2H_2SO_4$, is uncrystallizable, but the chloride, $C_{10}H_{14}N_2HCl$, may be obtained in crystals by passiug hydrochloric acid gas into nicotine under vacuo.

II. *Technically:*

1. *Hist. & Polit.:* A term used in Western Europe to designate the Russian Socialist movement, which began about 1870, and may be divided into two distinct periods: (1) "The going among the peasants." A number of young men and young women of the upper classes voluntarily went to work in the fields and the factories so as personally to carry on a Socialist propaganda and distribute Socialist literature. Their organs were the *Yperiod* (*Forward!*) of Loudou and the *Workman* of Geneva. This lasted about six years, during which time there were twenty-three political trials of 417 persons, half of whom were condemned to exile in Siberia or to hard labour in the mines. (2) In 1878 the struggle with the government commenced. At a congress held at Lipezk, shortly after Solovieff's attempt on the life of Alexander II., the acquisition of political freedom was declared to be the first necessity. It was hoped to gain this by the formation of a legislative body, elected by the people, with guarantees for electoral independence, and liberty to agitate for reforms. This was demanded from Alexander III. shortly after the assassination of the late Emperor as the price of cessation from violence. The Nihilist programme is an agrarian socialism based on communal property. The discoveries of the police show that Nihilism is widely spread in Russia, not only among the working, but among the well-to-do classes, and even in the army, especially in Petersburg, and in many of the principal cities and towns.

2. *Metaph.:* The doctrine that refuses a substantial reality to the phenomenal existence of which man is conscious.

This opinion is traceable in the writings of Peter Lombard and Abelard, and even to the early school of Antioch, which maintained that God clothed Himself with humanity as with a garment. It was condemned at the Council of Lateran in 1179.

2. *Hist. & Polit.* (*Pl.*): A name given in western Europe to the adherents of the Russian Socialist movement. In this sense the name is unknown in Russia. It was first applied by Ivan Tourgeneff to the hero of his novel *Fathers and Sons*, who was intended to be the personification of a movement in Russia, about 1860, for the emancipation of women, the independence of children, and the spread of natural religion.

"Since 1876 the number of *Nihilists* of both sexes has greatly increased."—*Daily Telegraph*, Feb. 14, 1885.

nĭm'-bŭs, *s.* [Lat. = a cloud.]

1. *Art:* A term applied, especially in sacred art, to a halo or glory surrounding the head in representations of divine or sacred personages. The nimbus is of pagan origin, and was probably derived from the Romans, who

ornamented the statues of their divinities and emperors with radiated crowns. The aureola, with which the nimbus is frequently confounded, envelopes the whole body, while the nimbus is limited to the head. Nimbi are properly depicted in gold, but sometimes in stained windows they appear of various colours. The nimbus of God the Father is generally represented of a triangular shape, with rays diverging from it in all directions; that of Christ contains a cross, more or less enriched; that of the Virgin Mary a circlet of small stars; those of angels, a circle of small rays, surrounded by another circle of quatrefoils, like roses, interspersed with pearls. When the nimbus is depicted of a square form, it indicates that the person was living when delineated, and is affixed as a mark of honour and respect. As an attribute of power, the nimbus is often seen attached to the heads of evil spirits. In many illuminated books of the ninth and following centuries, Satan wears a crown.

* **I.** *Ordinary Language:*

1. A name, a title, a designation.

"There wanteth a term or *nomenclature* for it."—*Bacon: Natural History.*

2. A vocabulary, a dictionary, a glossary.

II. *Science:* The names taken collectively of the objects of study in any branch of science. Sometimes it includes, but more generally it is distinguished from, terminology. In botany, for example, the names assigned to the several classes, orders, tribes, genera, species, &c., are its nomenclature; the definition of the various words, whether substantives or adjectives, used in describing a plant, belong to terminology. The designation, *Rosa canina* (Dog-rose), falls under the department of nomenclature; nectary, diœcious, &c., under that of terminology. The subject of scientific nomenclature has been investigated and reported on by committees of several scientific bodies.

1. *Biol.:* The practice of using two names—one generic, the other specific; it originated with Linnæus. [2, 6.]

2. *Bot.:* Linuæus laid down thirty-one rules for the guidance of botanists in nomenclature; some of these have fallen into disuse. [¶ 1.] Orders generally end in -aceæ, tribes in -eæ, and their sub-divisions in -idæ. Botanical assemblages with the last-named ending are called, in this work, families; though family in botany is sometimes made synonymous with order. This brings them into harmony with zoological families in -idæ, to which they are apparently equivalent.

3. *Chem.:* The spoken language of chemistry, which at every period of its history reflects the stage of its development. The early belief that the heavenly bodies determined the character of terrestrial matter led to the use of such names as sol = gold, luna = silver, and mercury, the name by which the metal is still known. Later, the physical character of the substance gave rise to the name of the compound, as in milk of lime, sugar of lead. But the present system is, with some minor variations, the work of Lavoisier, Berthollet, and Morveau, and appeared in 1787. The leading principle is that the names of compound bodies should express the simple substances they contain, and their relative proportions. Generally the root-word is employed, together with certain terminations and prefixes to indicate the degree of oxidation and the number of atoms of the elements contained in it—*e.g.,* KNO_3 = potassic nitrate, KNO_2 = potassic nitrite, HNO_3 = nitric acid, HNO_2 = nitrous acid. The following compound shows the manner in which the numeral prefixes are employed: $Hg_4 \left\{ \begin{matrix} Cl_2 \\ O_2 \\ N_2 \end{matrix} \right.$ = tetra-mercuro-tetra-hydric-dioxi-dichloro-dinitride. The above rule does not apply strictly to organic substances, where regard is had to the history of the groups forming the compound.

4. *Geol.:* For the names given to the geological formations, as Silurian, Devonian, Oolite, &c. (see Geology). The system adopted has many merits, but in one direction it tends to generate error. When a stratum is called chalk, one naturally expects it to be white and calcareous; it may be neither the one nor the other. When another is called greensand, the mind expects it to be characterized by grains of sand of green colour, it may be quite different. Such words, used of the spots where the several strata were first identified, are appropriate; but, being founded on local peculiarities, become quite inaccurate when applied to other, and speci-

ally to distant regions. Used of the world at large, they are simply chronological, and have no reference to the appearance of particular rocks.

5. *Min., Petrol., & Palæont.:* Linnæus carried his system of two Latin names through the mineral no less than the animal kingdom. Thus, he had his *Schistus tabularis, S. atratus,* &c. These are now exchanged for the vernacular terms. Minerals are now generally made to end in -ite, which Dana alters for rocks to -yte. Genera of fossils often end in -ites, as Belemnites, anglicised Belemnite.

6. *Zool.:* In the days of Swainson and the other adherents of the quinary system, conformity of system in the nomenclature was greatly insisted upon. Every tribe ended in -es, every family in -idæ, and every sub-family in -inæ. Of late, the system has been departed from, and the great aid which it rendered to the memory in consequence sacrificed. With regard to vernacular names, they vary in different parts of the country, and often suggest error. Thus the goat-sucker does not suck goats, and the titmouse is not one of the Muridæ, but a bird. They are regarded as unscientific, and used only for popular convenience in scientific works. [1.]

It was revived and applied to the two thousand clergymeu, who had to surrender the livings on account of their inability to conform to the more celebrated Act of Uniformity, 14 Charles II., c. 4, first enforced on Aug. 24, 1662. The former word denotes that he feels differently from Churchmen, that his sympathies go in a different direction; the latter word refers, not to his feelings, but to his action with respect to public worship. Nŏn-jür′-ŏr, *s.* [Lat. *non* = not, and *juro* = to swear.]
Church Hist. (*Pl.*): A term applied to those of the clergy and laity of the Establishment, who, holding that James II. was sovereign *de jure* after the throne had been declared vacant, refused to take the oath of allegiance to William III. and his successors. Among these were Sancroft, Archbishop of Canterbury, and six bishops—Turner (Ely), Lloyd (Norwich), Frampton (Gloucester), Lake (Chichester), White (Peterborough), and Ken (Bath and Wells). Sancroft sanctioned the consecration of a bishop, and thus a schism arose. The Nonjurors themselves divided on the question of Nonjurors' usages (q.v.), and each party consecrated bishops. Gordon, the last prelate of the regular body, died in 1799, and so the Nonjurors proper came to an end. Boothe, the last of the irregularly constituted bishops, died in Ireland some twenty years later. (*Lathbury*; see also *Macaulay: Hist. Eng.*, ch. iv.)

A. *As substantive:*

Law: The stoppage of a suit during trial. This is done by the judge when, in his opinion, the plaintiff fails to make out a legal cause of action, or to support his pleadings by any evidence.

"It is usual for a plaintiff, when he or his counsel perceives that he has not given evidence sufficient to maintain his issue, to be voluntarily *nonsuited*, or withdraw himself: whereupon the crier is ordered to call the plaintiff; and if neither he, nor anybody for him, appears, he is *nonsuited*, the jurors are discharged, the action is at an end, and the defendant shall recover his costs. The reason of this practice is, that a *nonsuit* is more eligible for the plaintiff, than a verdict against him; for after a *nonsuit*, which is only a default, he may commence the same suit again for the same cause of action; but after a verdict had, and judgment consequent thereupon, he is for ever barred from attacking the defendant upon the same ground of complaint. But in case the plaintiff appears, the jury by their foreman deliver in their verdict."—*Blackstone: Comment.*, bk. iii., ch. 13.

B. *As adj.:* Nonsuited.

Norman architecture, *s.*

Architecture:

1. *In France:* The Normans brought the Romanesque style to a high state of perfection in this country. Whilst the simplicity of the entire structure and the general effect bear witness to the Roman origin of the style, yet there is displayed a rich treatment of details. Both piers and arches are moulded, and the ornamentation, especially that which serves as a rich setting to the arches, consists of the most simple line patterns; as, for instance, the meander, or the zigzag, or of bands or fillets occurring in regular succession; frequently, also, it is composed of various enrichments resembling the squares of a chessboard, lozenges, or nail-heads. Norman workmanship was, at first, remarkable only for its solidity. The walls were of great thickness, and often built of rubble, faced with small squared stones—a manner of building which had been copied from the works which the Romans had left behind them in France.

2. *In England:* English Romanesque (more commonly called Norman) architecture is to be considered as a branch and offshoot of that of Normandy; for, while many peculiarities of detail crop up, the main features of the original style are distinctly observed. The earliest work of the Normans which exists in this country was conducted by Gundulph, who, after rebuilding his cathedral at Rochester, was employed by William to superintend the construction of the White Tower, in the Tower of London, which contains within its walls perhaps the only ecclesiastical remnant of the Conqueror's time at present in existence. Simplicity of design and detail is not met with in the same degree as in Normandy itself. Very richly moulded features are introduced into heavy masses of building, and more ornamentation is employed, which is introduced in an arbitrary manner. The plan of the churches was the same as in Normandy. All were built with the semicircular chancel, but the arches of the nave usually rested on heavy cylindrical piers, hardly ever to be found in French churches, except in crypts. The windows and the doors were the same as in Normandy, and the Norman mouldings were introduced with little alteration. The walls were remarkably thick, and without prominent buttresses. Specimens of the time of Rufus are to be seen in the west end and nave of Rochester cathedral; the choir, side aisles, and middle transept at Durham; in the walls of the lower part of the western façade of Lincoln; the tower and transept

of St. Alban's; and the oldest remaining parts of Winchester. A strongly-marked mode of enrichment, resembling scales or diamonds in its design, was generally employed on the surface of the walls; the arches were ornamented for the most part with the usual zigzag. The character of the exterior of buildings in the Norman style may be described as heavy and massive. The windows were generally small. Blind, narrow arcades often occur in the façades and towers, sometimes interlacing, and sometimes not so, in several ranges, one above the other. The Norman style is of frequent occurrence in the case of the castles of the feudal lords of the epoch. The nucleus of these buildings, which were in reality fortresses, consisted of a high and massive tower, which served at the same time for the residence of the lord and for purposes of defence. This tower was only accessible by a flight of steps leading along the wall to an upper storey of the building, and was only lighted by very small windows. In the last

quarter of the twelfth century the transition from the Norman to the Pointed style began. The earliest examples of this transition are the round part of the Temple Church, London, consecrated in 1185; the choir of Canterbury Cathedral, rebuilt after the fire, in 1175; and the great tower at the west end of Ely Cathedral, built by Bishop Ridel, who died in 1189. I. *Ordinary Language:*

*1. Originally, amongst the ancient Romans, a person employed to take notes of trials, proceedings in courts, contracts, &c.; a shorthand writer. This kind of work was at first usually performed by slaves, but the notarii, as they increased in ability and raised themselves above the servile ranks, gradually assumed the duties and functions of the tabelliones, writers who, under the Roman law, were employed in drawing up contracts, wills and commercial documents, and the work which fell to them in this capacity corresponded very closely to some of the business now undertaken by the modern notary public, the solicitor, attorney, and conveyancer.

2. A public official authorized to attest signatures in deeds, contracts, affidavits, declarations, and especially such as are to be sent to foreign countries. They note and protest bills of exchange, draw up protests after receiving the affidavits of mariners and masters of ships, and administer oaths. Frequently called a Notary Public.

"Go with me to a *notary*, seal me there
Your bond." *Shakesp.: Merchant of Venice*, i. 3.

¶ From a document dated 1574, it appears that the Company of Notaries in London at that time numbered sixteen, and that they got their living by the "Making of Policies, Intimations, and Renunciations, and other writings," for the doing of which a monopoly had just been granted to one Richard Candler. nō-tā'-tion, *s.* [Lat. *notatio* = a marking, a noting, from *notatus* = pa. par. of *noto* = to mark, to note; *nota* = a mark.]

1. The act of marking or noting; the act or practice of recording anything by means of marks, characters, or figures.

2. A system of marks, notes, signs, or characters employed in any art or science, to express in a brief and compendious form certain facts connected with that art or science. [¶.]

*3. Etymology; etymological signification.

"The *notation* of a word is, when the originall thereof is sought out; and consisteth in two things, the kind and the figure."—*Ben Jonson: English Grammar*, ch. viii.

¶ (1) *Architectural Notation:* A system of signs, marks, or characters, appended to figures, when used to denote dimensions on drawings, as ′ for feet, ″ for inches, ‴ for parts: as, 10′ 6″ = ten feet six inches.

(2) *Arithmetical Notation:* A system of figures or characters used to represent numbers. Two methods of expressing numbers are at present in use, the Roman and the Arabic.

In the Roman method seven characters are employed, called numeral letters. These, standing separately, represent the following numbers, viz., I. for one, V. for five, X. for ten, L. for fifty, C. for one hundred, D. for five hundred, and M. for one thousand. By combinations of these characters, in accordance with the following principles, every number may be expressed: (*a*) when a letter stands alone, it represents the number given above, as V. for five; (*b*) when a letter is repeated, the combination stands for the product of the number denoted by the letter by the number of times which it is taken: thus, III. stands for three; XXX. for thirty, &c.; (*c*) when a letter precedes another, taken in the order given above, the combination stands for the number deuoted by the greater diminished by that denoted by the less: thus, IV. stands for five less one, *i.e.*, four; XC. for one hundred less ten, *i.e.*, ninety, &c.; (*d*) when a letter, taken in the order giveu above, follows another, the combination stands for the sum of the numbers denoted by the letters taken separately: thus, XI. stands for ten plus one, *i.e.*, eleven: LV. for fifty plus five, *i.e.*, fifty-five: C1V. for one hundred plus four [1V = five less one, *i.e.*, four as in (*c*)], *i.e.*, one hundred and four: MDCCCLXXXV. for eighteen hundred and eighty-five. This method of notation is now little used except for dates, headings of chapters, &c.

In the Arabic, or rather the Hindoo, method, introduced by the Arabs into Europe at the close of the tenth century, numbers are represented by the symbols, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, and their combinations, according to conventional rules. The characters are called figures or digits, and, taken in their order, stand for naught, one, two, three, four, five, six, seven, eight, nine: the value of the unit depends upon the place which the figure occupies in the scale adopted. The value of each figure or digit increases in a tenfold ratio from the right to the left; the number of places of the digit from the right to the left indicating the power of 10, and the digit itself the number of such powers inteuded to be expressed; thus, 10 = ten taken once = ten; 200 = ten squared taken twice = 2×10^2; $7656 = 7 + 10^3 + (6 \times 10^2) + (5 \times 10) + 6$ = seven thousand six hundred and fifty-six, the values of the places being thus: 7 (thousands), 6 (hundreds), 5 (tens), 6 (uuits).

(3) *Chemical notation:* The written language of chemistry. The system now in use belongs exclusively to modern times, but in all ages signs of some kiud or other seem to have been employed to represent the various kiuds of matter. In 1815 Berzelius proposed the use of the initial letter of the element, and the employment of coefficients to express the number of the same atoms in the compound, bringing chemical notation almost into its present state. Thus, sulphate of soda = Na_2SO_4, indicating that the compound is formed of two atoms of sodium (natrium), one of sulphur, and four of oxygen. In organic compouuds, the constitution of which is kuown, the symbols are so arranged as to show the various groups of radicals. $\frac{CH_3}{CO(C_2H_5)O}$ = ethylic acetate, but butyric acid, with the same number of atoms, is expressed by $\frac{CH_3(CH_2)_2}{COHO}$.

(4) *Mathematical notation:* The conventional method of representing mathematical quantities and operatious by means of symbols. [Symbol.]

II. *Technically:*

1. *Music:*

(1) In general, any musical sound.

(2) In particular, the signs placed upon the stave which show by their shape and position the duration and pitch of sound. They constitute the essence of mensurable music as opposed to mere "signs of intonation," such as were the neumes. The first division of notes was, as might be expected, into long and short (breve or brief). The long was a four-sided note with a tail (𝅜); tho breve a four-sided note without a tail (𝅝); the semibreve a diamond note (𝅝). There are now six notes in ordinary use: viz., the semibreve (𝅝); the minim (𝅗𝅥); the crotchet (♩); the quaver (♪); the semiquaver (𝅘𝅥𝅯); and the demisemiquaver (𝅘𝅥𝅰). The half-demisemiquaver (𝅘𝅥𝅱) is also occasionally used. One semibreve is equal to two minims, or four crotchets, or eight quavers, or sixteen semiquavers, or thirty-two demisemiquavers, or sixty-four half-demisemiquavers.

(3) The term is used generally for the sounds of which notes are signs, as when we say of a singer that his high notes are good, or that a player plays wrong notes.

¶ *Notwithstanding* answers exactly to the Latin *non obstante*, used with a noun as an ablative absolute. Thus, in the extract given above, we might also read "His prohibitions *notwithstanding*," that is, his prohibitions not causing any obstacle or hindrance; and so we sometimes find *notwithstanding* placed at the end of the sentence or clause.

"He hath not money for these Irish wars,
His murderous taxations *notwithstanding*."
Shakesp.: Richard II., ii. 1

B. *As conj.:* Nevertheless, however, yet.

¶ The use of *notwithstanding* as a conjunction is only apparent, the word being still in its nature and use really a preposition, the object being omitted.

Philos: (See extracts).

"*Noumenon* is the antithesis to phenomenon. . . . *Noumenon* means the substratum, or, to use the Scholastic word, the Substance. Thus, as matter is recognised by us only in its manifestations (phenomena), we may logically distinguish those manifestations from the thing manifested; and the former will be the *materia circa quam*, the latter the *materia in qua*. *Noumenon* is, therefore, equivalent to the Essence; phenomenon to the manifestation."—*G. H. Lewes: Hist. Philos.* (1850), i. 76. (Note.)

"The notion of a *noumenon* is therefore no concept of an object, but the problem unavoidably connected with the limitation of our sensibility, viz., whether there may not exist objects quite independent of its intuition—a question which can only be vaguely answered by saying that as our sensuous intuition does not apply to all things indiscriminately, there is room for more and for other objects, so that they cannot be absolutely denied, but neither, in the absence of any definite notion, can they be affirmed as objects for our understanding."—*Kant: Critick* (ed. Mahaffy), p. 206.

He consecrated other bishops, and sent them to various parts to propagate his views—that it was wrong to receive again into the Church those who had sinned gravely after baptism; that the Church had no power to absolve the lapsed (q.v.), and that second marriages were sinful. ¶ *The Fourth Book of Moses, called Numbers:*

Old Test. Canon: The fourth book of the Pentateuch. In the Hebrew Bible it is called בְּמִדְבַּר (*Be-midhbar*) = in the desert, the fifth word of the first chapter. It has been sometimes quoted also as וַיְדַבֵּר (*Vaiedabber*) = And he spake—this being the first word of the book. The Septuagint translators uamed it Ἀριθμοί (*Arithmoi*) = Numbers. The reference is to two numberings of the Israelites. Chaps. i.–iv. give the details of the first census, and prescribe the order in which the tribes were to eucamp, and the arrangement and duties of the Levites; v. and vi. contain laws, including those relating to the Nazarites; vii. contains the offerings at the dedication of the tabernacle; viii.–x. 28, other laws and arrangements; x. 29–xiv., the historic narrative, including the sending out of the spies; xv. other laws; xvi. and xvii. the rebellion of Korah, Dathan, and Abiram, with the budding of Aaron's rod; xviii. and xix. Levitical laws, xx. and xxi. the striking of the rock, followed by a miraculous flow of water, the making of the brazen serpent [NEHUSHTAN]; xxii.–xxiv. Balaam's prophecies; xxv. sin with the Midianites; xxvi. the second census; xxvii.–xxxi. other laws and incidents, including the conquest of the Midianites; xxxii.–xxxv. the distribntion of the land east of the Jordan; an itinerary of the journey out of Egypt; the establishmeut of Levitical cities, and provision in cases of homicide by misadventure. The last chapter (xxxvi.) contains some provisions for the marriage of heiresses, so as to retain their inheritance in their own tribes.

The book spans a period of nearly thirty-nine years, commencing with the second year of the wanderings, the second month, and the first day, and terminating in the fortieth year. The Jews and the Christians of early and mediæval times implicitly believed in the Mosaic authorship of Numbers. Modern rationalists resolve the book into different portions, assigniug each to a separate writer. One eminent critic of this school considered that 274 verses of Numbers constituted the original narrative; that six verses, appearing to beloug to writings of some older time, were inserted by the Deuteronomist (q.v.), and the remaining 1,008 verses—more than three-fourths of the book—belonged to the Later Legislation. The 274 verses of the original narrative are thus given:—

"Ch. x. 29—36; xi., xii., xiii. 1—3, 17—20, 22—24, 28 (except to Kadesh), 27—31, 33; xiv. 11—25, 39—45; xvi. 1, 2, 12—15, 23—34 (except Korah, &c., in vers. 1, 24, 27, 32); xx. 1, 14—22; xxi. 1, 13, 16—20, 31—35; xxii. 2—41; xxiii., xxiv., xxv. 1—5; xxxii. 1, 16—24, 33—42."

The six verses from old sources assigned to the Deuteronomist are xxi. 14, 15, 27–30. (*Colenso: On the Pentateuch*, vi. 88.) These views created some excitement wheu first published, but they have failed to makc any considerable impression on the Christian public.

II. *Alg. & Arith.:* A term which stands opposed to literal, and implies that the numbers composing a given expression are denoting by figures, and not by letters. A numerical equation is an equation in which all the quantities, except the unknown or variable quantities, are numbers. Numerical, as opposed to algebraical, is applied to the values of quantities; thus we say, that -5 is uumerically greater than -3, although its algebraical value is less. The numerical value of an expression, in algebra, is the number obtained by attributiug numerical values to all the quantities which enter the expression, and performing all the operations indicated. Thus, the numerical value of $a^2b - c^2d$, where $a = 2$, $b = 3$, $c = 1$, and $d = 2$, is 10.

"The *numerical* value of a concrete quantity is its ratio to a selected magnitude of the same kind, called the unit. It varies directly as the coucrete quantity itself, and inversely as the unit, in terme of which it is expressed."—*Everett: C. G. S. Syst. of Units* (1875), p. 1.

numerical-aperture, *s.*

Optics: The formula by which the illuminating and resolving power of high-power microscopic objectives is now calculated. Since it became customary to interpose water, oil, or other fluid between the object and the lens, it is found that a water-immersion lens of 97½°, and an oil-immersion of 82°, give equal results to a dry or air lens of 180°. This obviously depends on the diameter of the *back* lens of the objective, and this upon the refractive index of the medium between lens and object. It is expressed by the formula, $n \sin u$, where n is the refractive index of the medium—air or fluid—and u the semi-angle of aperture. It is thus found that an oil-lens of 180° (oil of ref. index 1·52) has an N.A. of 1·52 against 1·00 for 180° in air. This only represents the comparative diameters of the effective pencils, and the relative *illumination* is, of course, obtained by squaring the N.A.'s to get the comparative areas of the pencils. We thus find that an oil-lens of 180° gives 2·310 the illumination of a dry objective of 180°.

1. A virgin or widow who has consecrated herself to the service of God by the three vows of poverty, chastity, and obedience, and bound herself to live in a religious house under a certain rule. The first authentic uotice of nuns is that by St. Antony, who, when retiring from the world, placed his sister in a house of virgins. St. Augustin, of Hippo, and St. Scholastica, sister of St. Benedict, both founded nunneries, and all the great orders of men have orders of women affiliated to them or following their rule as closely as difference of sex will permit. Communities founded since the Council of Trent mostly follow the rule of St. Augustin, with certain modifications. Nearly all nuns are bound to the recitation of the divine office in choir, and take their meals in common, but each has a separate cell. Their occupations vary. Some devote themselves to the work of education, to nursing the sick, or the care of the poor. Others are contemplative. Excommunication is denounced against any one attempting to force a woman to become a nun against her will, or to prevent her from becoming a nun without just cause. Since the Oxford movement several communities of religious women have been established in England. [Deaconess, Profession, Veil.]

1. *Astron.:* As the attraction of the sun, tending to drag the equator down to the ecliptic which causes the precession of equinoxes [PRECESSION], is greatest at the solstices and ceases at the equinoxes, the precession of the equinoxes cannot be uniform, but varies from time to time. Similarly the moon produces a slight variation in different parts of her monthly revolution. But besides this, the moon, which does not move in the ecliptic but in an orbit inclined to the plane of the ecliptic, has a movement like that of the precession of the earth's equinoxes, which causes the place of the intersection of her orbit with that of the sun to revolve every nineteen years. During half of this time the moon's path is little inclined to the earth's equator, while during the remaining portion of the time it is much inclined. Hence her influence over the time of the earth's equinoxes is unequal. The irregularities in the movement of the earth's equinoxes and her axis caused in the three ways are called nutation. nў'-a-ya, *s.* [Sansc., from *ni* = iuto, and *aya* = going.]

Philos.: One of the six schools of Brahmanic philosophy, and regarded as eminently orthodox. It was founded by Gotama, who must not be confounded with the Gotama or Gautama generally looked on as the founder of Booddhism, though the tenets of both were much akin. The Nyaya philosophy begins with the assertion that supreme felicity is derivable from trne knowledge. Ignorance, by producing faults and activity, became the cause of birth. The world is a compound of good and evil, pleasnre and pain; but it must be renounced, effort and activity abandoned, and the soul separated from body and mind. The world is held to be in a state of suffering, the doctrine of the transmigration of souls accepted, and men are uiged to look forward to final emancipation from pain, birth, activity, fault, and false notions, in which case they shall attain supreme felicity. (*Banerjea: Dialogues on the Hindu Philosophy.*)

O.

O, The fifteenth letter, and the fourth vowel of the English alphabet. The shape of the written letter was probably suggested by the circular formation of the lips in uttering the sound. *O* is called the labial vowel, *i* being the palatal vowel, and *a* the guttural. In English *o* has six distinct sounds or shades of sound: (1) The sound of *o* in *not*, as in *pot* (marked in this book ŏ). (2) The same sound lengthened by a following *r*, as in *or*; and in the digraph *ou*, as in *fought, sought* (unmarked, **o**). (3) The sound of *o* in *go*; and in the digraphs *oe*, as in *foe, toe*; *oa*, as in *groan, moan, boat*; and *ou* in *though* (marked **ō**). This sound is modified by *r* following the vowel, as in *more* (marked **ō**). (4) The sound of *o* in *who, move, tomb*; and in the digraphs *oo*, as in *room, soon*; and *ou*, as in *through, wound* (marked **ô**). (5) The sound of *u* in *bull* or *full*, as in *wolf, woman* (marked **o͝**). (6) The sound of *u* in *tub*, as in *son, love, come*; and in the digraphs *oe*, as in *does*; *oo*, as in *blood*; *ou*, as in *enough, tough* (marked **o͞**). The long *o* in modern English, as iu *go*, represents an A. S. *á*, as in *bone* = A. S. *bán*, *loaf* = A. S. *láf*, *stone* = A. S. *stán*.

O. *As a symbol is used:*

1. As a numeral.

* 5. A cry to call attention, or to command a cessation of noise, &c.

B. *As interj.:* An exclamation used in earnest or solemn address, entreaty, appeal, or invocation, and prefixed to the noun of address. Attempts have been made to distinguish between O and Oh by some writers: namely that O should be used only in direct address to a person or personified object, and should never be followed by the exclamation point, while Oh should be used in mere exclamations, where no direct address or appeal is made to the object, and may be followed by the exclamation point or not, according to the nature or construction of the sentence. This distinction is, however, merely arbitrary, and is not regarded by most writers, even the best, the two forms being generally used indiscriminately.

"*O*, be not proud." *Shakesp.: Venus & Adonis*, 113.

ō-, *pref.* [Ir. *o* = a descendant; Gael. *ogha*; Scotch *oe* = a graudson.] A common prefix in Irish surnames, and meaning son of; equivalent to Mac in Gaelic, Fitz in Norman French, and the suffix -son in English surnames.

I. Any species of the genus Quercus. The oaks are numerous in species, and are found in all parts of the Northern Hemisphere, except the extreme north. They are more numerous in America than in Europe, while a few only are found in Asia. They are highly regarded from the strength and durability of their wood, long used in ship building, and from the value of their nuts, or *mast*, in feeding swine. These are usually bitter, but *Q. æsculus*, of Italy, bears a sweet and edible nut, and the same is the case with the Dwarf Chestnut Oak of the United States and some others. *Q. robur*, the English Oak, has for centuries been used in that country for ship building. In the United States the best oak for this purpose is *Q. virens*, the Live Oak, of the Southern States. The White Oak (*Q. alba*) is also highly esteemed for this purpose. 1. A solemn affirmation or declaration made with an appeal to God for the truth of what is affirmed. By the appeal to the Supreme Being, the person making oath is understood to invoke His vengeance if that which is affirmed or declared is false; or, in case of a promissory oath, if the promise or obligation is wilfully broken. Oaths are of two kinds: (1) Assertory oaths, or those oaths by which the truth of a statement is affirmed: as an oath sworn to the truth of an affidavit; (2) Promissory oaths, or those oaths by which something is promised, or an obligation is assumed: as, the oaths of witnesses; the oath of allegiance, by which the person taking the oath promises allegiance (q.v.) to the government. Modern legislation has also provided particular forms of oaths for Jews; has permitted affirmations to be made by persons who have conscientious objections to take an oath; and has otherwise greatly relieved those required to swear from the penalties and disabilities consequent on the neglect or refusal to take the oaths. Witnesses are allowed to swear to the truth of

their evidence in any way which is binding upon their consciences.

"But whatever be the form of an *oath*, the signification is the same."—*Paley: Moral Philosophy*, bk. iii., ch. xvi.

2. A careless and blasphemous use of the name of the Divine Being, or of anything divine or sacred, either by way of appeal or imprecation, or as a profane exclamation or ejaculation.

"With *othes* gret he was so sworne adoun."
Chaucer: C. T., 3,843.

Ford: Sun's Darling, i. 1.

II. *Technically:*

1. *Bot.:* Panic-grass; a plant of the genus Panicum.

2. *Chem.:* The meal of the oat deprived of its husk. It is one of the most important and valuable articles of food, containing a greater proportion of protein compounds than the finest wheaten flour. An analysis of a sample of Scotch oatmeal gave 13 per cent. of nitrogenous material, 60–70 per cent. of heat givers, and 3 per cent. of mineral matter. It is a strong food, and requires much cooking in order to burst its starch cells; the longer it is cooked the more digestible it becomes. Oatmeal is frequently adulterated with barley meal; this is readily detected by the microscope, the granules of the barley being round, and very much larger than those of the oat.

Nothing is known of the history of the last-named prophet. He is not the same as the Obadiah of 1 Kings xviii. 3–7. or of 2 Chron. xvii. 7.

2. *Old Test. Canon:* The fourth of the minor prophetic books. It contains only one chapter of twenty-one verses, denouncing vengeance against the Edomites for their unbrotherly conduct, when, on the occasion of the capture of Jerusalem by a heathen foe, they helped to plunder that capital, besides cutting off fugitive Jews and surrendering refugees (10–14). Prophecy is then made of the future glory in store for the Jews (17–21). If, as is probable, the capture of Jerusalem referred to was that by Nebuchadnezzar, then the book was written after the year B.C. 588. It is related to Jeremiah xlix. 7–22. (Cf. specially Obadiah 1–6, 8, 16, with Jer. xlix. 14, 15, 16, 9, 10, 7, 12. Which is the original has not been decided: Obadiah 1, 19, 21, is the same in theme as Amos ix. 11, which may possibly explain why Obadiah immediately follows Amos in the Bible.

4. A party, a following. This use of the

term arose in the fourteenth century, when the seat of the papacy was transferred to Avignon by Clement V. Obelisks were commonly formed from a single stone, mostly of granite. There are, however, two small obelisks in the British Museum formed of basalt, and one at Philæ of sandstone. Obelisks were erected in pairs, and many still exist on the ancient sites, while others have been removed and set up elsewhere. The first obelisk is said to have been erected by Rameses, King of Egypt, in the time of the Trojan war; it was 40 cubits high, and employed 20,000 men in building. There are about a dozen Egyptian obelisks erected in Rome. The largest is that from Heliopolis. It is of granite, and now stands before the north portico of the Church of St. John Lateran, where it was erected in 1588. Its whole height is about 149 feet; without the base, 105 feet. It was removed to Alexandria by Constantine, and to Rome by his son Constantius, and placed in the Circus Maximus. The obelisk at Luxor was presented to the French nation, in 1820, by Mehemet Ali, and was re-erected in Paris in 1833. Its height is 73 feet. The obelisk at Alexandria, known as Cleopatra's Needle, and presented to the English nation at the same time, was allowed to lie prostrate and half buried by the sand, until removed to England and set up on the Embankment in London. The second Cleopatra's Needle was presented to the United States by the Khedive, and brought to this country in 1881. It stands in Central Park, New York. Far the largest obelisk in the world is the Washington Monument, at Washington, D. C.

ō′-bĭ (1), *s.* [OBEAH.]

Anthropology:

1. A system of sorcery prevalent, though not to so great an extent as formerly, among the negro population of the West Indian colonies. It appears to have been brought from Africa by negroes who had been enslaved, and to these obeah-men (or women) the blacks used to resort for the cure of disorders, obtaining revenge, conciliating favor, the discovery of a thief or an adulterer, and the prediction of future events. The practice of obi had become general towards the close of the last century, both in the West Indies and the United States, and there is little doubt that the obeah-men exercised vast influence, and that they carried on a system of secret slow poisoning, the effects of which were attributed by their more ignorant fellows to obi. The system resembles other superstitions of savage peoples. It may have originated in ancient religious practices, in which sorcery bore a large part.

2. The magical power or influence by which the purposes enumerated in def. 1 were supposed to be obtained.

"The multitude of occasions which may provoke the negroes to exercise the powers of *Obi* against each other."—*B. Edwards: Brit. West Indies* (ed. 1819), ii. 111.

3. A kind of fetish in which the power known as obi was supposed to reside.

"The *obi* is usually composed of a farrago of materials, most of which are enumerated in Jamaica law, viz., blood, feathers, parrots' beaks, dogs' teeth, alligators' teeth, broken bottles, grave-dirt, rum, and eggshells."—*B. Edwards: Brit. West Indies* (ed. 1819), ii. 111, 112.

¶ *To put obi on:* To bewitch by means of obi. When this was done for purposes of revenge, the person on whom obi was put usually fell into a morbid state of body and mind, terminating only by death. This was either the effect of a disordered imagination, or, more probably, of poison.

ŏc'-cu-pan-çў, *s.* [Eng. *occupant*; *-cy.*]

I. *Ordinary Language:*

1. The act of occupying or taking possession.

2. The act of occupying or holding in possession; the time during which one occupies or has possession of anything; the time during which one is an occupant.

II. *Law:* The taking possession of those things which before belonged to nobody, and the right acquired by so taking possession. This, the original and only primitive method of acquiring any property, has been restrained and abridged by the laws of society, in order to maintain peace and harmony among mankind. For this purpose, gifts, contracts, wills, legacies, &c., have been introduced, in order to transfer and continue that property and possession in things personal which has once been acquired by the owner. In some few instances this original right of occupancy is still permitted and recognised. Thus the benefits of the elements, the light, the air, and water can only be appropriated by occupancy.

"*Occupancy* is the taking possession of those things, which before belonged to nobody; a right, however, which, so far as it concerns real property, has been confined by the laws of England within a very narrow compass. It extended only to a single instance; namely, where a man was tenant *pur auter vie*, or had an estate granted to himself only, without mentioning his heirs, for the life of another man, and died during the life of *cestuy que vie*, or him by whose life it was holden: in this case, he that could first enter on the land might lawfully retain the possession, so long as *cestuy que vie* lived, by right of *occupancy*. This seems to have been recurring to first principles, and calling in the law of nature to ascertain the property of the land, when left without any owner. For, had the estate *pur autre vie* been granted to a man and his heirs during the life of *cestuy que vie*, there the heir might enter and hold possession, being called in law a special occupant. But the title of common *occupancy* is now reduced almost to nothing by two statutes, directing that the estate *pur autre vie* after payment of debts shall go in a course of distribution like a chattel interest. That of special *occupancy*, by the heir-at-law, continues to this day; such heir being held to succeed to the ancestor's estate, not by descent, but as an occupant specially appointed by the original grant. If no special occupant be named, when the estate *pur auter vie* is of a freehold or any other tenure, it shall go to the personal representative of the person that had the estate thereof by virtue of the grant, and be distributed in the same manner as the personal estate of the testator or intestate."—*Blackstone: Comment.*, bk. ii., ch. 13.

That he'll not stir." *Marston: Satires.*

II. *Law:* One who takes possession of that which before belonged to nobody. [Occupancy.]

"Movables found upon the surface of the earth, or in the sea, and are unclaimed by any owner, are supposed to be abandoned by the last proprietor; and, as such, are returned into the common stock, and therefore belong, as in a state of nature, to the first *occupant*, unless they fall within the description of waifs, or estrays, or wreck, or hidden treasure; for these are vested by law in the sovereign."—*Blackstone: Comment.*, bk. ii., ch. 23.

ō′-cean (ce as sh), * o-ceane, *s.* & *a.* [Fr. *océan*, from Lat. *oceanum*, accus. of *oceanus* = the ocean, the main sea, from Gr. ὠκεανός (*ōkeanos*) = the great stream supposed to surrouud the earth; Sp. & Ital. *oceano.*]

A. *As substantive:*

1. *Lit. & Science:* The sea, using that term in its widest sense. Properly speaking, there is but one ocean or sea, all the salt water on the globe, with a few trifling exceptions, like the Caspian, the Sea of Aral, and the Dead Sea, being more or less in complete communication with each other. Different portions of the ocean havo received distinctive names: the Arctic, the Atlantic, tho Indian, the Pacific, and the Antarctic oceans, five in all; or if the Atlantic and Pacific be separated into a northern and a southern portion by the Equator, then there are seven in all. The unequal heating of portions of the vast expanse of water on the globe, the rotation of the earth, and other causes tend to keep the water in constant circulation and preserve it from being stagnant and impure. [Current.] The winds also agitate the surface, producing waves. [Wave.] The attractions of the moon and sun cause tides. [Tide.] Tho area of the ocean is about 145,000,000 square miles, or nearly three-fourths of the whole surface of the earth. It largely modifies the temperature of the adjacent lands, tempering the heat of summer and the cold of winter. As far as observation has yet extended, the average depth of the ocean is not more than 2,000 fathoms, *i.e.*, somewhat above two miles. The *Challenger* expedition, which returned to Spithead on May 23, 1876, after three and a half years' absence, took in all four hundred soundings. Seven soundings gave less than a thousand fathoms, whilst north of Papua, in lat. 11° 23′ N., long. 143° 16′ E., the depth was 4,575 fathoms or 27,450 feet. Subsequent soundings have established that it is a trifle deeper off the Kurile Islands, being 4,655 fathoms. Ordiuarily the portion of the ocean fringing the shores is but a few hundred feet deep, but a little further from the land the depth suddenly becomes 2,000 fathoms or more. At 62° Fahr. the relative deusity of salt and freshwater is as 1·0275 to 1. The ocean has been salt tbrough all known geological periods. The origin of this saltness is a difficult geological problem. Whilst on land the temperature rises as mines or borings become deeper, the opposite occurs with the ocean. As a rule, the surface water is the warmest. The old views as to the absence of animal life in ocean depths have been proved erroneous by the recent expeditions. Abundant life has been brought up from the ocean depth. The level of the ocean remains permanent from age to age. It is the land that is upheaved or subsides, not the ocean which has risen to a higher or sunk to a lower level. The colour of the ocean varies in different places, being as a rule greenish near the shore and blue in the deeper parts. The saltness of the ocean, the nature of the bottom where it is shallow, and the colour of the clouds overhead, all modify the colour.

Two wheels of the same diameter, and turning freely on the same axis, are placed face to face; the edge of one is cut into 100 teeth, and that of the other into 99 teeth, and an endless screw works into the notches in each wheel. When the screw has turned 100 times around, the wheel having 99 teeth will have gained one notch on the other, which gain is shown by an index attached to one wheel, which passes over a graduated arc on the other. Every hundred turns are thus registered on the second wheel, and all turns less than a hundred are shown by a separate index. Now, instead of the screw turning on its axis, it is found more convenient to have the screw fast, and to allow the weight of the machine to be suspended freely, so that as the carriage wheel turns, the effect is the same as turning the screw on its axis.

(1) The fixed oils used in painting on canvas, &c., are linseed, walnut, and poppy, expressed from the seeds and purified in various ways, and rendered drying by the addition of the oxides of lead or zinc. Cold-drawn linseed oil is the best for use, especially after being boiled upon charcoal to separate the mucilage and other impurities. These oils are the vehicles or media in which the pigments are ground and diluted for use; they should be pale in colour, limpid, and transparent, and should dry quickly. The essential oils used in painting are those of turpentine for diluting the pigments ground in oil, and of spike or lavender for wax and enamel painting.

The mineral oils, and many of the volatile oils of vegetable origin, are simply compounds of carbon and hydrogen, but the larger proportion of vegetable and animal oils contain oxygen in addition, whilst a few also contain nitrogen and sulphur, as in oil of mustard. The vegetable and animal oils containing oxygen are mostly glycerides of fatty acid, and are characterized by being insoluble in water, slightly soluble in alcohol, but readily soluble in ether.

The power of resistance to detrimental change becomes less after the climacteric (q.v.), and prepares the way for the total failure of some essential organ with fatal results. [DEATH.]

Old Catholics, *s. pl.*

Church Hist.: The name assumed by a body of German priests and laymen who refused to accept the dogma of Papal Infallibility, and, in consequence of its definition, formed themselves into a separate body. It was essentially a University movement, for the German bishops who had left Rome to avoid voting—Hefele among the number—afterwards submitted. Von Schulte, a professor at Prague, published a formal protest; then came the Nuremberg protest of "Catholic professors" (Aug., 1870). Father Hyacinthe's "Appel aux Evêques" followed in *La Liberté* early in 1871, and (March 28) Dr. Döllinger set forth his reasons for withholding his assent "as a Christian, a theologian, an historical student, and a citizen." Döllinger and Friedrich were immediately excommunicated. In the September following a Congress was held at Munich, when it was resolved to seek re-union with the Greeks. In 1872 a second congress was held at Cologne, at which Dean Stanley was present, and sent an account to the *Times*, which aroused much interest in England. On Aug. 11, 1873, Dr. Reinkens was consecrated at Rotterdam by Dr. Hey de Kamp, Jansenist Bishop of Deventer, and, in 1876, Dr. Reinkens consecrated Dr. Herzog. The first synod (1874) made confession and fasting voluntary; the second (1875) reduced the number of feasts, and admitted only such impediments to marriage as were recognised by the State; the third (1876) permitted priests to marry, but forbade them to officiate after marriage. This prohibition was annulled by the fifth synod (1878), and, in consequence, Friedrich, Reusch, and some others withdrew. Congregations of Old Catholics exist in Austria, Italy, Spain, Switzerland, France, and Mexico, but their numbers are small. In Germany they seem to be dwindling away, but the protest of Döllinger and his fellows will remain an important landmark in religious history.

It is rarely above twenty-five feet high, but is of slow growth, and reaches a great age. Two varieties are known, the Oleaster (q.v.), not to be confounded with any of the modern order Thymalaceæ, and the cultivated variety. The former is spiny, and has worthless fruit; the many sub-varieties of the latter are unarmed and have large, oily fruits. The specific name *europœa* implies that Europe was its native continent, which is doubtful. Its original seat was probably western Asia, and perhaps Europe as well. It was very early brought into cultivation, and in classic times was sacred to Minerva. It was very abundant in Palestine, and even yet there are fine olive plantations near Jerusalem, Nabulus (formerly Shechem), &c. It is often meutioned in the Old Testament by the Hebrew name זַיִת (*zaith*), and in the New by that of ἐλαία (*elaia*). Both are correctly translated olive. The Mount of Olives was named from it, and Gethsemane means an oil-press. "We have regarded the reproduction, with intent to signify something of the natural tones and cries, as the positively earliest speech; but this would so immediately and certainly come to be combined with imitative or *onomatopoetic* utterances, that the distinction in time between the two is rather theoretical than actual. Indeed, the reproduction itself is in a certain way *onomatopoetic*."—*Whitney: Life & Growth of Language*, ch. xiv.

(*Calcutta Exhib. Rep.*)

ŏ-nō′-spĭn, *s.* [From *ono(nis)* *spin(osa).*] [ONONIS.]

Chem.: $C_{60}H_{68}O_{25}$. Produced, together with formic acid, by boiling ononin with baryta-water. ontological argument, ontological proof, *s.*

Philos.: An argument for, or proof of the existence of God, derived from the very idea which man has of God—the greatest object or being that can be conceived. This conception exists in the intellect of all such as have the idea of God, and in the intellect of the atheist as well, for he understands what is expressed by "the absolntely greatest." Bnt the greatest cannot be in the intellect alone, for then it would be possible to conceive something still greater, which should exist not only in the intellect, but in external reality. Hence the greatest must exist at the same time in the intellect and in the sphere of objective reality. God, therefore, is not simply conceived by man; he also really exists. The ontological argument was thus formulated by Anselm (1033–1109), and was revived in the seventeenth century by Descartes. (*Ueberweg.*)

2. *Geol. & Palæont.:* The term is not now generally petrological, but is chiefly chronological, being applied to a certain considerable portion of the Secondary period and to the strata then deposited. A band or belt of oolitic rocks, about thirty miles in breadth, crosses England obliquely from the coast of Yorkshire to that of Dorsetshire. The oolite is thus divided:—

I.—Upper Oolite.

1. *British:* (1) Purbeck beds; *a.* Upper, *b.* Middle, *c.* Lower; (2) Portland stone and sand; (3) Kelloway Rock.

2. *Foreign:* (1) Marnes and *Gryphæa virgula* of Argonne, (2) Lithographic Slate of Solenhofen.

II.—Middle Oolite.

1. *British:* (1) Coral Rag, (2) Oxford Clay, (3) Kelloway Rock.

2. *Foreign:* Nerinæan Limestone of the Jura.

III.—Lower Oolite.

1. *British:* (1) Cornbrash and Forest Marble, (2) Great or Bath Oolite, (3) Stonesfield Slate, (4) Fuller's Earth of Bath, (5) Inferior Oolite.

Foreign: Undetermined.

The oolitic rocks affect the physical geography of the parts of England which they traverse. The clays and shale, decaying rapidly, give rise to long valleys, and the calcareous strata of the Upper, Middle, and Lower Oolite make three parallel ridges, the chalk above constituting a fourth. A similar appearance is produced in the same way in France between Paris and Metz. During the Oolitic period England and Europe were largely covered by the sea, hot enough to be studded in places with coral reefs and contain certain cephalopods like Ammonites and Belemnites. At intervals muddy sediment so clouded the water as to kill the coral animals. This series of events was repeated more than once. Islands in the sea had a vegetation of Cycads, Ferns, Coniferæ, &c. Reptiles abounded, birds had apparently come into being [Archæopteryx], and mammals of the Marsupial type. Some trap rocks in the Morea, in the Apennines, &c., seem to have proceeded from volcanoes active at this time, and some granites in the Alps appear coutemporaneous. [Jurassic.]

3. *Comm., &c.:* Some of the oolitic limestones, as the Bath stone, are excellent for building.

1. A dramatic entertainment, in which music forms an essential and not merely an accessory part. The opera is composed of solos, recitatives, duets, trios, quartetts, or other pieces for single voices; choruses and finales; accompanied throughout with instruments variously combined to produce certain desired effects. Overtures or introductions precede the whole work or its several acts in nearly every case. The dramatic effect is heightened by the accessories of costumes and scenery, but they are not absolutely indispensable. The libretto or book of words rarely possesses any claim to literary merit, but serves as a mere framework for the composer. In many of the German and French operas of a lighter character spoken dialogue is introduced in the place of recitative, and the same practice is often observed in English opera, so called. There are many varieties of opera, but the chief are: the grand opera or *opera seria*, the romantic opera or *opera drammatica*, and the comic opera or *opera bouffa*, for which the French term *opera bouffe* has been adopted in England and America. The opera is of Italian origin, and of comparatively modern date, and is the immediate successor of the miracle-plays with music.

Survey* (1875), vol. v.) enumerates three species. *Ophibolus getulus* is the King-snake of America, a deadly foe of the rattlesnake, which it overcomes and devours. ŏph′-ĭ-cleīde, *s.* [Fr. *ophicléide* (lit. = key-serpent); pref. *ophi-*, and Gr. κλείς (*kleis*), genit. κλείδος (*kleidos*) = a key.]

Music: A wind instrument of metal, invented to supersede the serpent in the orchestra and in military bands. It consists of a wide conical tube, terminating in a bell like that of a horn, having ten ventages with keys, and a mouthpiece like that of the serpent. There are two sorts of ophicleides, alto and bass. The bass ophicleide is written on the F-clef, and its compass is three octaves and one note, from B on the third space below the bass staff, to C on the third space of the treble staff. They are in two keys, C and B♭. The alto ophicleide has a compass similar in extent to that of the bass instrument, but starting from a note one octave higher. This instrument is not so satisfactory as its bass fellow, and is therefore but rarely heard. The double-bass ophicleides are in F and E♭, a fifth below the bass ophicleides in C and B♭. The amount of breath required to play the double-bass ophicleide will probably prevent its general adoption.

OPHICLEIDE.

1. *Zool.:* Snakes; an order of the class Reptilia, which is placed by Prof. Huxley in his division Sauropsida (q.v.). The body is always cylindrical and vermiform, covered with horny scales, but without a bony exoskeleton. Vertebræ procœlous, with rudimentary transverse processes. They have no steruum, pectoral arch, forelimbs, or sacrum; nor, as a rule, are traces of hinder limbs present, though they occasionally occur, *e.g.* in Python (q.v.). Hooked conical teeth are always present, anchylosed with the jaw. [POISON-FANG.] The order is pre-eminently tropical, the species rapidly diminishing as the distance from the Equator increases, and wholly ceasing before the Arctic or Antarctic Circle is reached. The classification is not fixed. According to Wallace, the order contains twenty-five families. There is another and natural division into three sub-orders: (1) Thanatophidia (Venomous Snakes), with two groups, Proteroglyphia and Solenoglyphia; (2) Colubriformes (Innocuous Colubriform Snakes); and (3) Typhlopidæ (Blind Snakes).

2. *Palæont.:* First found in the Eocene of Sheppey, others from Miocene of Germany,

and in some Tertiary beds in the United States. Most of these appear to have belonged to the Pythonidæ. Poison-fangs have been found in some of the later Tertiary deposits, and a colubrine snake from the Upper Miocene of the South of France. (*Wallace.*) The more important genera will be described under their names.

opium-traffic, *s.*

Hist., &c.: In China, India, Turkey, and other parts of the East, and, to a small extent, in the West, opium is used as a narcotic drug. The great source whence China has always derived its opium has been India, where, since 1793, the drug has been a government monopoly, the cultivators in Behar, Benares, and Malwa being paid at a fixed rate for their crops for exportation to China. The trade, which was conducted in clippers, was contraband; the Chinese government having in 1796 prohibited the importation of opium,

and issued various subsequent proclamations on the subject, of the same tenor as the first. Nevertheless, by the connivance of the Chinese local officers, the importation about trebled in the twenty years between 1816–17 and 1836–37, in the two latter years being 20,049 chests, valued at more than £2,000,000. In March, 1839, the Chinese authorities, without warning given, enforced the law, forbade all foreigners to quit Canton, and ordered them to deliver up the opium in their possession, which was burnt. War with Britain resulted, which ended in the defeat of the Chinese, who were obliged to pay an indemnity for the opium. They have since been compelled to admit it, and the Indian revenue derivable from its growth has risen to about £9,000,000 annually. The religious community in general dislikes the opium traffic, and sections of it at times take active steps for its abolition.

He divided his treatise on the subject into four parts. 1. On the Reflection and Refraction of Light: (1) Catoptrics (q.v.), (2) Dioptrics (q.v.). 2. Physical Optics. 3. On the application of optical principles to the explanation of Natural Phenomena. 4. Of Optical Instruments. The more modern division of the science is into: 1. Sources of Light; 2. Transmission, Velocity, and Intensity of Light; 3. Reflection of Light—Mirrors; 4. Single Refraction—Lenses; 5. Dispersion and Achromatism; 6. Optical Instruments; 7. The rays from the object to be drawn are reflected from a plane-mirror through the object-glass of the instrument to a speculum, and thence through an eye-glass to the eye. Between the eye and the speculum is a piece of parallel faced glass with a small dot in its centre, exactly in the focus of the eye-glass. By moving the pencil, the dot seen in the field of the telescope is passed over the outlines of the object, which are at the same time traced on the paper by the pencil.

Leibnitz maintained that, if there was to be a world, it must consist of finite beings; this is the justification of finiteness and liability to suffering, or metaphysical evil; that physical evil, or pain, is salutary as punishment, or means of tuition; and that God could not remove moral evil, or wrong, without removing the power of self-determination, and, therewith, the possibility of morality itself. J. S. Mill (*Three Essays upon Religion*, p. 40) points out that Leibnitz did not maintain that this is the best of all conceivable, but of all possible, worlds, so that his doctrine (though not that of his caricature, Pangloss) might be held by a "limited" Theist.

The phrase (= the work of the worker) is used to signify that the effect of a particular rite or act of devotion is directly due, not to the rite (*opus*) itself, but to the dispositions of the person who is the subject of the rite or who practises the devotion. This is the Protestant view of the efficacy of the sacraments, as opposed to the Roman and High Anglican view. [Opus operatum.]

opus operatum, *phr.*

Roman Theol.: Usually employed adverbially (*ex opere operato*). The expression opus operatum (= the work done) was used by mediæval theologians to signify that grace was conferred by the sacrament itself, and adopted by the Council of Trent, which, in the eighth canon (*De Sacramentis in genere*) of the seventh session, anathematizes any one who shall say that the sacraments do not confer grace *ex opere operato.* The necessary dispositions on the part of the recipient are *conditiones sine qua non;* and, according to the Roman view, the grace conferred is due, not to these necessary dispositions, but to the sacrament as received with these necessary dispositions.

"When we say the sacrament confers grace *ex opere operato*, our meaning is that grace is conferred by virtue of the sacramental act itself instituted by God for this end, not by the merit of the minister or the recipient."—*Bellarmin: De Sacramentis*, lib. ii., 1.

"Would I had met my dearest foe in heaven
Or ever I had seen that day, Horatio!"

II. *Anthrop.:* Oracles are of high antiquity. They existed among the Egyptians (Herod. v. 89, viii. 82), and the poetry of the Greeks and the Romans is full of allusion to them. The Hebrews might lawfully, by the high priest, consult the Urim and Thummim (Num. xxvii. 21), but they also illicitly sought responses from teraphim (Judges xvii. 5), and from the gods of surrounding nations (2 Kings, i. 2, 3, 6, 16). The responses were supposed to be given by a supernatural afflatus, either through a person, as at Delphi and Cumæ, or through some object, as in the rustling of the sacred grove at Dodona. But in every case there is present the idea of a power more than human taking possession of a person or thing, and making that person or thing the vehicle of the response. (Cf. Num. xxiii., xxiv., Acts xvi. 16; Homer, *Odys.* v. 396; Virgil, *Æn.* vi. 45–51). Tylor holds that the belief in oracles was a consequence of animism, and, after giving instances of the survival of the belief among races of low culture, says (*Prim. Cult.*, ed. 1873, ii. 138), "Could a South Sea Islander have gone to Delphi to watch the convulsive struggles of the Pythia, and listen to her raving, shrieking utterances, he would have needed no explanation whatever of a rite so absolutely in conformity with his own savage philosophy."

ō-răn', *s.* [ORANG-UTAN.]

orang-utan, orang-utang, ourang-outang, *s.*

Zool.: Simia satyrus, the Mias of the Dyaks. The name by which it is known in England is Malay, and signifies, "the wild man of the wood." It is a dull, slothful animal, but possessed of great strength. Wallace (*Malay Peninsula*, ch. iv.) says that he was told by a Dyak chief that "no animal dare attack it but the crocodile and the python. He always kills the crocodile by main strength, standing upon it, pulling open its jaws, and ripping up its throat. If a python attacks a mias, he seizes it with his hands, and then bites it, and soon kills it. The mias is very strong; there is no other animal in the jungle so strong as he." These animals are now confined to the swampy forests of Sumatra and Borneo. Their height has been variously stated, but, according to Wallace (*loc. cit.*), "we have not the least reliable evidence of the existence of Orangs in Borneo more than four feet two inches high." The legs are very short, the arms as disproportionately long, reaching to the ankle when the animal is placed in an erect position. The hair is long, ruddy-brown, with a decidedly red tinge, face dark, eyes and nose small, jaws prognathous, the hair falling over the forehead and backward over the neck; it is long on the limbs, with a downward direction on the upper, and an upward on the lower arm. There are neither cheek pouches nor natal callosities, nor a tail, and the hips are covered with hair. The males have a longish beard, and they sometimes develop warty protuberances on each side of the face. Hence some authorities have discriminated two species, but Dr. Mivart considers these to be merely varieties. [SIMIA.] The resemblance to man in appearance is greatest in the females and in young animals. The head of a baby Orang is not very different from that of an average European child; but in the adult the muzzle is as well-marked a feature as in the Carnivora. The Orang is arboreal, and forms a sort of nest or shelter among the trees. It never walks erect, unless when using its hands to support itself by branches overhead, or when attacked. Representations of its walking with a stick are entirely imaginary.

ŏr'-ạnge (a as ĭ), * **or-enge,** * **or-onge,** *s. & a.* [O. Fr. *orenge* (Fr. *orange*). The word should properly be *narenge*, from Pers. *náranj*,

II. *Botany, &c.:* Properly *Citrus Aurantium*, the sweet orange. The leaves are ovate, oblong, acute, slightly serrulated; petiole more or less winged; the pulp is sweet. It is a native of India, and by some botanists is believed to be only a variety of the citron (*Citrus medica*). It was introduced into the south of Europe about the twelfth century, having been brought into Arabia about three centuries earlier. It lives about six hundred years. Among the many varieties are the China orange, which is the common orange of the markets; the Blood, or Malta orange; the St. Michael's orange; the Noble, or Mandarin orange, &c. A single tree in St. Michael's has yielded 20,000 oranges fit for packing. The orange contains malic acid; the rind is bitter and aromatic. There are various allied species, specially the Bitter, or Seville orange, *C. Bigaradia*, largely imported for the manufacture of candied orange-peel, &c. It, too, has run into several varieties. Another species is the Bergamot (q.v.). Sir Joseph Hooker makes all these varieties of *C. Aurantium*. The orange is largely cultivated in the United States, particularly in California and Florida, both of which states have proved particularly adapted to its culture. There are 10,000 square miles of soil in Florida adapted to orange growth, and the fruit from that state is often of especial excellence. Louisiana is another important locality of orange culture.

They claim to do honour to the memory of William III., but their action towards their Roman Catholic countrymen is greatly opposed to the tolerance shown by that monarch; for example, at the capitulation of Limerick (1691). In the third decade of this century, Brunswick Clubs, an offshoot from the original institution, were founded to oppose Catholic Emancipation. Orangemen in Ulster wear the flowers of the Orange-lily (*Lilium bulbiferum*), on July 1 and 12, the anniversaries of the Boyne (1690) and Aughrim (1691), and they also celebrate November 5, on which day the Prince of Orange landed in Torbay (1688).

fleshy, or tuber-like roots. Leaves flat, terete, or equitant, generally sheathing, membranous, coriaceous, or hard; flowers irregularly clustered, spiked, racemose, or panicled, with a solitary bract. Perianth adherent, in two or three rows, sometimes resupinate; sepals three, petals three, stameus and style consolidated into a central column, stamens three, only one perfect; ovary often twisted, one-celled, of six carpels, with three parietal placentæ. About seventy are known. The United States has few native species of orchids, but many of tropical origin are cultivated here in greenhouses, their beauty or singularity gaining for them high admiration. They are nearly always fertilized by insects, to which fact is believed to be due their singularity of form and their frequent great fragrance. Few of them are of any utility. The tubers of various orchids yield salep (q.v.).

Ger. *urtéli*, *urteili.*] [DEAL, DOLE.]

A. *As substantive:*

1. *Lit. & Anthrop.:* The *judicium Dei* of mediæval writers; the practice of referring disputed questions (especially those touching the criminality of a suspected person) to supernatural decision, in the belief that the Deity would work a miracle rather than the innocent should suffer or the guilty escape punishment. Dr. E. B. Tylor (*Encyc. Brit.*, ed. 9th, xvii. 818) says of the practice, that "in principle, and often in the very forms used, it belongs to ancient culture, thence flourishing up to the mediæval European and modern Asiatic levels, but dying out before modern civilization." It existed among the Jews. A wife accused of adultery was required to drink "the bitter water that causeth a curse" (Numbers v. 12–31), and a strangely similar institution exists at the present day among the negroes of the Gold Coast; and ordeal in some form or other is still practised by races of low culture, and by individuals of low culture among races standing in the forefront of civilization. In the Middle Ages in Europe ordeal was sanctioned both by the civil and the ecclesiastical authorities, and was chiefly of three kinds: (1) By fire—a survival from the early classic times (cf. Sophocles, *Antigone*, 264; Æschylus, *Frag.* 284), in which the accused had to walk barefoot and blindfolded over red-hot ploughshares, or to take up and carry a piece of red-hot iron a certain distance. This method was allowed only to persons of high rank; (2) By water, for persons of the middle and lower classes. This was of two kinds. The accused had to take a stone out of boiling water, and if, after a certain time, his arm presented no marks of injury, he was adjudged innocent. In the second case—a common method when witchcraft was alleged—the accused, bound hand and foot, was thrown into a river or pond, and it was believed that a guilty person would float without effort, and that an innocent person would infallibly sink; (3) Wager of battle. [BATTLE, s., B. I.] Besides these three principal methods there were three others in less general use: A supposed murderer was required to touch the body of the murdered man, and was pronounced guilty if blood flowed from the wounds (*Shakesp.: Richard III.*, i. 2); the Ordeal of the Eucharist, in which divine judgment was supposed to follow unworthy receptiou of the sacrament; and the Corsned (q.v.).

2. *Fig.:* A severe or strict trial through which one has to pass; trying circumstances.

B. *As adj.:* Pertaining to or connected with trial by ordeal: as, *ordeal* laws.

ordeal-bean, ordeal-nut, *s.*

Bot., &c.: The seeds of *Physostigma venenosum*, a leguminous plant used in Old Calabar, of which it is a native. Persons suspected of witchcraft, or more ordinary crime, are required to eat the beans till they vomit them or die. If they do the former, they are held to be innocent; if the latter, they are considered to be guilty. The Calabar Ordeal-bean contracts the pupil of the eye.

ordeal-root, *s.*

Bot.: The root of a species of Strychnos used by the native populatiou of western Africa.

ordeal-tree, *s.*

Botany:

1. *Of Guinea: Erythrophlæum guineense.*

2. *Of Madagascar: Cerbera Tanguin.* The fruit, which is poisonous, is given in some kind of broth to the accused person. If he recover, he is deemed innocent; if he die, this is held to prove his guilt. On May 9, 1830, the then reigning Queen of Madagascar administered the ordeal to about thirty men, some noblemen and others of the common people, who were accused of sorcery. The former recovered, the latter died. Certain women, subjected to the same ordeal in April, all recovered.

or-dẽr, * or-dre, *s.* [Fr. *ordre* (O. Fr. *ordene*, *ordine*), from Lat. *ordinem*, accus. of *ordo* = order; Sp. *orden*; Ital. *ordine.*]

I. *Ordinary Language:*

1. Regular or methodical disposition or arrangement; method; harmonious relation between the parts of anything; regular succession: as,

(1) Of material things arranged methodically.

(2) Of intellectual notions or ideas: as, the orderly arrangement of the matter of a discourse.

(3) Of recurring phenomena, periods of time: as, The *order* of the months.

2. Proper state or condition; a normal, healthy, or proper condition: as, The organs of the body are in or out of *order*.

3. Established process; customary mode of procedure; established usage; specif., the established or customary mode of procedure in public debates or discussions.

4. Absence of confusion or disturbance; tranquillity; freedom from disorder or tumult; regular government: as, To keep *order* at a meeting.

¶ *Order* is used alone as an exclamation to call the attention of a speaker or member of an assembly or meeting to the fact that he is transgressing the rules of debate or otherwise out of order.

"Then there was a cry of *order*; and he was threatened with the serjeant and the Tower."—*Macaulay: Hist. Eng.*, ch. xxiv.

5. A rule, a regulation: as, a standing *order*. [¶ (11).]

6. A precept, a mandate; a direction, whether verbal or written.

"They have already *order*
This night to play before him."
Shakesp.: Hamlet, iii. 1.

7. Specifically:

(1) A direction, demand, or instruction to supply goods, to make purchases, &c.; a commission.

(3) A ticket of admission to a place of entertainment, &c.; a free pass: as, an *order* for a theatre.

8. A class, a rank, a degree.

"The king commanded the high priest and the priests of the second *order*, to bring forth out of the temple all the vessels."—2 *Kings* xxiii. 4.

9. A body of men of the same rank or profession, constituting a separate or distinct class of the community.

"Find a barefoot brother out,
One of our *order*."
Shakesp.: Romeo & Juliet, iii. 3.

10. A body of persons associated together by the possession of a common honorary distinction conferred upon by a prince or other authority; hence, the dignity, rank, or distinction itself: as, The *Order* of the Garter, the *Order* of St. Michael and St. George. The various orders have distinctive insignia, consisting generally of a collar, star, badge or jewel, and ribbon. [Bath, Garter, Knighthood, Star, Thistle, &c.]

II. *Technically:*

1. *Arch.:* The different modes of architectural treatment adopted by the ancients in constructing their public edifices and buildings of the higher class. They are usually separated into five, principally distinguished from each other by the proportions of their columns and the kind of capitals employed, but also by the relative proportions and decorative parts of their entablatures, as well as other minor features. They are known as the Doric, Ionic, Corinthian, Tuscan, and Composite. (See these words.)

2. *Ecclesiastical:*

(1) In the Roman Church, "a Sacrament of the New Law by which spiritual power is given, and grace conferred for the performance of sacred duties." The Council of Trent (sess. xxiii.) asserted, and anathematised those who denied (1) That there was a real priesthood in the New Law; (2) that, besides the priesthood, there were grades of orders; (3) that Order was a Sacrament instituted by Christ; (4) that the Holy Ghost was given and a character conferred at ordination; (5) that unction was properly used in ordination; (6) that there was a divinely appointed hierarchy in the Roman Church; (7) that bishops were superior in power to priests, and were the ministers of Confirmation and Order; and (8) that bishops appointed by the Roman Pontiffs were true and legitimate bishops. The doctrine of Apostolical Succession is a necessary deduction from the view that Order is a Sacrament.

(2) (*Pl.*): In the Roman Church Orders are divided into two classes: Sacred, or Major, and Minor Orders (see these words). Some theologians regard the episcopate as the completion and extension of the priesthood, while others consider it a separate order. In the East the number of orders has varied at different times, but in the Greek, Coptic, and Nestorian Churches the orders recognised are those of bishop, priest, deacon, subdeacon, and reader. Anglicans acknowledge three: bishops, priests, and deacons. The validity of Anglican Orders is denied by the Roman Church. English clerics entering that church, and wishing to become priests, must be ordained by a Roman Bishop. The question assumed great practical importance in connection with the Oxford movement, and the arguments for and against their validity may be seen in Dr. Lee's *Validity of English Orders*, and the late Canon Estcourt's *Question of Anglican Ordinations Discussed*.

3. *Geom.:* Rank or class. In analysis, magnitudes are classed into orders, depending upon the degree of their equations. All algebraic magnitudes whose equations are of the first degree are of the first order; those whose equations are of the second, third, &c., degrees, are respectively of the second, third, &c., orders.

Eccles. & Church Hist.: The name Order is popularly given to all associations of a monastic character. Strictly speaking, it is of far less extended application, and is confined to associations which have received the formal approbation of the Roman Pontiff and the members of which are bound by solemn vows. Thus Orders are sharply marked off from Congregations, in which the vows are simple, and for the erection of which the consent of the Ordinary alone is necessary. The term Order did not come into use till the tenth century, when offshoots from the Benedictines first appeared, and grew into such communities as those of Citeaux, Cluny, and La Chartreuse, where modifications of the Benedictine rule were practised. Next in importance come the Mendicant Orders and the Jesuits, the Hieronymites, the Minims, Theatines, Capuchins, and Barnabites. (See these words.)

II. *Ritual:*

1. *Roman:* The act of conferring the sacrament of order. Women are incapable of being validly ordained (1 Cor. xiv. 34; 1 Tim. ii. 11, 12). Ordination is, in the normal course of things, conferred by bishops, but abbots may confer minor orders on their subjects. Dimissory letters are necessary if a man is to be ordained for a diocese other than that in which he was born, and he must have legitimate and sufficient title (q.v.). Ordination to sacred orders, according to the general law of the Church, can only take place on the Saturdays in the four Ember weeks, on the fifth Saturday in Lent, or on Holy Saturday, and always during mass. Minor orders (q.v.) can be conferred at general ordinations, and also on any Sunday or holiday, not necessarily during mass. The Council of Trent (sess. xxiii., can. 8, *de Ref.*) enjoins that sacred orders should be publicly conferred in the cathedral or in one of the principal churches of the diocese, in the presence of the canons, but custom has sanctioned a departure from the practice when a reasonable cause exists. Regulars are usually ordained in their monasteries. [ORDER, *s.* II.]

2. *Anglican:* Strictly speaking, the term ordination is used only of priests, deacons being "made," and no lower order being recognised. Order is not a sacrament in the Anglican Church, though there is more than a tendency on the part of High Churchmen to recognise it as such, and the Rev. Orby Shipley (*Gloss. Eccles. Terms*, s. v. *Ordination*) says, "The ordination of priests has generally been counted among the five lesser Sacraments of the Church." [ORDER, *s.* II. (2).] Ordinations are held on the Sundays following the four Ember seasons, and the canonical interstices are observed. [INTERSTICE, *s.* ¶.]

3. *Presbyterian:* Ordination by laying on the hands of the Presbytery is required before a probationer obtains the full status of a minister. It is not conferred unless he have received a call as pastor or an appointment as a missionary. Elders are ordained by the Session.

ord-nançe, * or-den-ance, * or-din-ance, * or-don-ance, *s.* [The same word as *ordinance* (q.v.).] The original meaning was the bore or size of the gun, and thence the word came to be applied to the gun itself, exactly as in the case of Caliver (*Skeat*).] [ORDINANCE.] Cannons, great guns, howitzers; fire arms too large and heavy to be fired from the person; artillery.

¶ There have been great developments in recent years in the making of Ordnance, the size and calibre of cannon having immensely increased. Rifled guns of 12 to 16 inches calibre are now made, capable of throwing a ball of from half a ton to a ton weight to a distance of a number of miles. Their penetrative power is immense.

ordnance-survey, *s.* The official survey of Great Britain and Ireland, carried out at the expense of the country by the Royal Engineers, assisted by civilians. This survey originated in the mutual desire on the part of English and French scientific men to determine the precise difference of longitude between the meridians of the Greenwich and Paris observatories. The maps or plans are plotted to various scales. The scale adopted in the case of towns of 4,000 or more inhabitants is $\frac{1}{500}$ of the linear measurement, or 126·72 inches to a mile, or one inch to 41⅔ feet; that for parishes is $\frac{1}{2500}$ of the linear measurement, which is equivalent to 25·344 inches to a mile, or one square inch to an acre; that for counties 6 inches to a mile, and that for the general map of the kingdom one inch to a mile. The maps exhibit in exact proportions property divisions, rivers, roads, houses, &c., and give at frequent intervals the heights above ordnance datum (q.v.).

Min. (*Pl.*): Substances found in the earth from which metals are obtained by various processes, but chiefly by roasting and smelting. Ore consists of metals mineralized by chemical combination with one or more of the non-metallic elements. The principal ores are combinations of metals with sulphur, forming sulphides; with chlorine, forming chlorides; with oxygen, forming oxides; and with carbonic, silicic, sulphuric, arsenic, and phosphoric acids, forming carbonates, silicates, sulphates, arsenates, and phosphates. Generally speaking, however, all mineral substances containing metals, combined or free, are called ores. They are found in veins or lodes, in bedded masses, and also disseminated in rocks of all ages, both igneous and stratified sedimentary. In the latter, the ores of iron and manganese are the most abundant, and often occur in beds of large extent. Some ores, as well as native metals, are also found in alluvial deposits; gold, platinum, &c. in those known as placers; and the oxide of tin in those known as stream-works, from which much ore has been obtained in Cornwall and the Malay Peninsula, and of late years in New South Wales. These have been derived from the degradation and wearing away of older rocks, the minerals having been washed out and re-deposited by the agency of water.

I. *Ordinary Language:*

1. An instrument; the means by which any office, duty, or function is performed; that by which some important action is performed or object attained; espec. one of those parts of an animal or vegetable body by which some particular action, duty, operation, or function is performed; a natural instrument: as, The eye is the *organ* of sight; the lungs are the *organs* of respiration; animals and plants have reproductive *organs*, &c.

2. A medium, means, or instrument of communication between persons; a medium or channel of conveying or expressing one's opinions. (*Cowper: Task*, ii. 355.)

* 4. A musical instrument of any kind.

5. The vocal organs collectively; the voice.

* 6. Palate, taste. (*Gentleman Instructed*, p. 367.)

II. *Technically:*

1. *Anat.* (*Pl.*): Members of an organized being through which its functious are executed. Thus the root, stem, and leaves of a plant, the heart, &c., the brain and stomach of an animal are organs. They are composed of tissues.

2. *Music:* The most comprehensive and important of all wind instruments. Its history can be traced back to the earliest antiquity. Starting from a small collection of pipes, perhaps even from a syrinx, it has gradually grown in size and complexity until, at the present day, one performer has complete control over many thousands of pipes. The עוּגָב (*ugab*), translated "organ," in Genesis (iv. 21) and Job (xxi. 12), was probably one of the earliest and simplest forms of a collection of pipes placed over a wind-box or sound-board. In this rudimentary state, the wind was admitted to each pipe at the will of the player by means of a sliding strip of wood, which could be pulled in and out; this mechanism was the ancestor of our modern key-board. The next step was, to have more than one series of pipes; strips of wood passing lengthwise under the mouths of each set enabled the player, by pulling a stop, to exercise a choice as to which he used. Afterwards, as larger organs were constructed, the smaller were called "portative" because they could be carried about in processions, &c., and the large were called "positive" [POSIT], because they were fixtures. The essential principles of the construction of an organ were thus discovered, and it only remained to expand the instruments (1) by the placing of several organs under the control of one player, with a separate manual or clavier for each; (2) by the use of keys to be played by the feet, or pedals; (3) by the increase of the compass; (4) by the introduction of great variety of tone; (5) by perfecting the bellows and wind-supply, and placing the registers under the organist's control by means of mechanical appliances. It is probable that the use of water in ancient organs (hence called hydraulic organs) was merely for the purpose of graduating the exit of air from a chamber into the pipes. In modern instruments, four, or sometimes even five, rows of keys are found, each representing a distinct instrument; these are named after their use or characteristics; as, Great organ, that used for grand effects, the principal manual; Choir organ, that used for the accompaniment of voices; Solo organ, that containing stops for solo use; Swell organ, pipes placed in a distant box, with shutters opening and closing like venetian blinds, by means of which a *crescendo* can be made; Pedal organ, the pipes controlled by the pedals. Pipes range from 32 feet to ¾ inch in length; they are divided into two great classes: Fluc and Reed, names which need no explanation. The title of stops generally intimates their quality of tone, *e.g.*, Flute, Violin, Oboe, Clarinet, Trumpet, &c. The touch of a large organ is made "light" by levers filled with highly compressed air, hence called Pneumatic levers; the long array of stops is controlled by composition-pedals, combinatiou-pistons, or by ventils; and, lastly, mechanical means have superseded manual labour for blowing.

¶ By the old writers the instrument was called *the organs*, or *a pair of organs*.

¶ *Organ of Bojanus:*

Comp. Anat. & Physiol.: A double organ with two bilaterally symmetrical halves, one on each side of the body, just below the pericardium, communicating with it and with the mantle cavity, in the Lamellibranchiata. Octave couplers are those which act at the interval of an octave above or below.

Church Hist.: The name given to a corpus of religious opinions attributed to Origen (A.D. 185–253), a Father of the Church, and one of the most learned writers of his age. He was chief catechist at Alexandria, and was ordained priest, though he had rendered himself physically unfit from an erroneous conception of the teaching of Jesus in Matthew xix. 12. He was deposed from the priesthood in A.D. 229. The opinions attributed to him were: (1) That there is an inequality betweeu the Persons of the Trinity, the Father being the greatest; (2) the pre-existence of human souls, including that of Christ; (3) that mankind will not have material bodies at the Resurrection; (4) the limited duration of the punishment of the wicked and of the evil spirits; aud (5) the re-absorption of all intelligent beings into the Source of Being whence they sprang.

The ninth Article of the Church of England considers it "the fault and corruption of the nature of every man that naturally is ingendered of Adam, whereby man is very far gone from original righteousness, aud is of his own uature inclined to evil."

2. *Roman:* In the Small Catechism (ed. 1883, p. 17), published by authority, original sin is defined to be "that guilt and stain of sin which we inherit from Adam, who was the origin and head of all mankind." The Council of Trent (sess. v., *Dec. de Peccato Originali*) defines that Adam lost original jnstice not only for himself but for his descendants, and that he poured (*transfudisse*) sin—the death of the soul—into the whole human race. This is supported by a reference to Romans v. 12. The Council declared that nothing in the decree as to original sin was to apply to the Virgin Mary.

3. *Presbyterian:* The Confession of Faith considers that our first parents "being the root of all mankind, the guilt of this sin [the eating the forbidden fruit] was imputed, and the same death in sin and corrupted nature conveyed to all their posterity descending from them by ordinary generation" (ch. vi.). Ornithology:

1. *Sing.: Oriolus galbula*, the type-species of the family Oriolidæ (q.v.). It not unfrequently visits the British Islands in spring, and its conspicuous plumage, bright yellow contrasted with black, chiefly on wings and tail, often brings about its death. The nest is suspended under the horizontal fork of a bough, to both branches of which it is firmly attached; the eggs are of a shining white, sometimes tinged with pink, and sparsely dotted with purple. The bird known as the Oriole in the United States belongs to quite a different family (*Icteridæ*), which is strictly American. The splendid Baltimore Oriole (*I. galbula*) is magnificent in color, and marked by its peculiar nest, which is a long, purse-like structure, hanging from the end of some swaying branch. *I. spurius*, the Orchard Oriole, is a common species.

2. *Pl.:* The genus Oriolus, or the family Oriolidæ.

Ō-rī′-ŏn, *s.* [Gr.]

1. *Class. Mythol.:* A celebrated giant and hunter, the son of Hyrieus, a peasant, or, according to some, a prince of Tanagra.

2. *Astron.:* One of the fifteen ancient southern constellations, visible at some season of the year in every land, and a very conspicuous object in the winter sky. A line through the Pole Star and Capella, if produced, will cut it. It is somewhat quadrilateral in form, but has been supposed also to resemble the human form of the mythic giant Orion. On his right shoulder, at an angle of the quadrilateral, is Betelgeuse, a star of the first magnitude; on the left shoulder, at another angle, is Bellatrix, of the second magnitude; on the left ankle, at a third angle, is Rigel; and at the right knee, the fourth angle, is the star κ Orionis. Around the waist, inside the quadrilateral, is a belt with three stars in a line, viz., δ, ϵ, and ζ Orionis, all of the second magnitude. Formerly they were popularly called Jacob's Staff, the Golden Yard of Seamen, the Three Rings of Soothsayers, &c.; now they are more frequently termed the Gold Grains or Spangles of the Belt. Nearly a hundred other stars are visible to the naked eye in Orion, besides thousands which are telescopic. There is also an irresolvable nebula like the head of a fish below the belt. Its appearances under the spectroscope are those presented when gaseous matter is rendered luminous by heat. The Romans considered Orion to bring with it stormy weather. Virgil (*Æn.* i. 535) calls it "nimbosus Orion," and in other passages he alludes to the belief that this constellation was the herald of coming tempest.

3. *Script.:* The כְּסִיל (*kesil*) of Job ix. 9, xxxviii. 31, and Amos v. 8, is generally believed to be correctly rendered Orion. *Kesil* means foolish, or a fool, implying that the giant constellation, trusting to its size, was foolish enough to defy Heaven.

"Since this is a department of oryctology hitherto unexplored, I suppose I shall be justified in proposing some new terms. I include all the varieties of tracks under the term *Ornithichnites*; and if it be convenient to speak of the subject as a distinct branch of knowledge, I should call it Ornithichnology."—*Prof. Hitchcock*, in *Amer. or-nĭ-thŏl'-ō-ğў, *s.* [Pref. *ornitho-*; and Gr. *λόγος* (*logos*) = a word, a discourse; Fr. *ornithologie*; Sp. & Ital. *ornitologia.*]

Nat. Science: "The methodical study, and consequent knowledge of birds, with all that relates to them." (*Prof. Newton*, in *Encyc. Brit.*, xviii. 2). It embraces Caliology (which treats of nests), Oology, Pterylology, and Ornithotomy. Its earliest literature dates from Aristotle (B.C. 385–322), and every succeeding age has added its quota. To two Englishmen, however—Francis Willughby (1635–1672) and John Ray (1628–1705) is really due the credit of laying the foundation of scientific Ornithology. That part of the science which deals with the classification of birds is an unsettled state; but the fact that old classifications based on external characteristics are of little or no scientific value is now recognised. In the early part of this century Nitzsch made an attempt to introduce a better method. Sundevall followed, in the memoir he presented to the Academy of Sciences, Stockholm, in 1835; and Prof. Huxley, in a paper read before the Zoological Society (*Proc.*, 1867, 415–72), in which he made his celebrated announcement that "Birds are greatly modified Reptiles," proposed a morphological classification.

Entom.: Birds'-wing Butterflies; a genus of Papilionidæ. The wings, measuring fully seven inches in expanse, are velvety black, contrasted in *Ornithoptera brookeana* with spots of brilliant metallic green, replaced in *O. cræsus* by fiery orange, while the body of the latter is golden and its breast a vivid crimson. The species, which are numerous, are distributed over the islands of the Malay archipelago, reaching their maximum of size and beauty in the Moluccas. (*Wallace: Malay Archipelago.*)

or-nĭ-thō-rhўn'-chŭs, *s.* [Pref. *ornitho-*, and Gr. *ῥύγχος* (*rhungchos*) = a beak, a bill.]

Zool.: The sole genus of the family Ornithorhynchidæ, founded by Blumenbach (1800), the name Platypus, given by Shaw (1799), being previously taken for a genus of Coleoptera. Premaxillæ and mandible expanded anteriorly, and supporting a horny beak; teeth supplied functionally by horny structures; legs short, fitted for swimming; feet webbed, each with five well-developed toes, armed with large claws, and beyond which, in the fore-feet, the interdigital membrane is extended. On the heel of the male is a horny spur, with a basal gland, similar in structure to the poison-fang of a venomous snake. No evidence as to the function of this spur was obtainable till Mr. Spicer (*Proc. Roy. Soc. Tas.*, 1876, p. 162) recorded a case in which an animal used this weapon to inflict a severe wound, which was followed by symptoms of local poisoning. Tongue not extensile; tail rather short, broad, and depressed; eyes very small; fur close and soft. A single species, *Ornithorhynchus paradoxus* (Blum.), *O. anatinus* (Shaw), inhabits Australia and Tasmania. It is aquatic, and feeds on water-insects, small mollusca, and worms. For a long time a question existed as to the manner in which this animal propagated its species. The

"black fellows" asserted that it laid eggs; and that this fact was known to some Europeans, the following extract from a letter now lying before the writer of this paragraph will show:

"I remember —— being amused that —— should think the English people—the educated portion—should not know the Platypus laid eggs, for I recollect being told it when a child, and my mother pointing out the curious creature among the stuffed animals in the British Museum."

The question, however, was definitively set at rest by Mr. H. W. Caldwell (Sept. 1884), who has found that the Ornithorhynchus, though mammalian in its general structure, is beyond doubt oviparous, laying two eggs at a time. These are about ¾ in. in the longer, and ½ in. in the shorter diameter. The shell is white, strong, and flexible.

Egypt. Osiris has been identified with many of the Grecian divinities; but more especially with Jupiter, Pluto, and with Bacchus, on account of his reputed conquest of India. He was venerated under the form of the sacred bulls Apis and Mnevis; or as a human figure with a bull's head, distinguished by the name Apis-Osiris, and is usually represented as clad in pure white. ŏs'-mĭ-ŭm, *s.* [Gr. *ὀσμή* (*osmē*) = an odour.]

Chem.: A tetrad metallic element, discovered by Tennant in 1804. Symbol Os, atomic weight 199·2. Occurs combiued with iridium, forming the native alloy osmiridium, in platinum ore. To obtain the metal, osmium tetroxide is digested with hydrochloric acid, and metallic mercury, in a well-closed vessel, at 140°, the osmium being reduced and an amalgam formed. On distilling the amalgam in an atmosphere of hydrogen gas, the mercury and calomel pass over, leaving uetallic osmium as a black powder. Its properties vary according to the mode of preparation. In the pulverulent state it is black, destitute of metallic lustre, and has a density of 7. By passing the vapour of the tetroxide, mixed with hydrogen, through a glass tube heated to redness, the metal is deposited as a compact metallic ring, density 10. When heated to the melting-point of rhodium, it acquires a density of 21·4. It is the most infusible of all metals. In the finely divided state it is highly combustible, continuing to burn, when set on fire, till it is all volatilised. Osmium forms three chlorides: osmious chloride, $OsCl_2$; osmioso-osmic chloride, $OsCl_3$; and osmic chloride, $OsCl_4$; all produced by the action of chlorine gas on osmium. Five oxides are known: osmious oxide, OsO; sesquioxide of osmium, Os_2O_3; osmic oxide, OsO_2; osmious anhydride, OsO_3; and osmic acid, OsO_4. The first three form salts with acids, the fourth is a weak acid, and the fifth is usually regarded as au acid, but its salts are very unstable.

1. *Chem.:* Osmosis. The mixing of dissimilar substances through a porous diaphragm—a phenomenon due to the attraction which the liquids have for each other. When liquids or gases are separated by a membrane, such as a bladder, it is generally found that the quantities passing in opposite directions are unequal. In the case of water and alcohol the water passes into the alcohol, but only a small quantity of alcohol is found in the water. When a colloidal substance is on one side of the diaphragm and water on the other, the latter only passes through.

Found also in England, continental Europe, Asia, and America. The powdered stem has been used successfully in rickets, the dose being three drachms. (*Sir J. Hooker*, &c.) Sometimes this fern has been called Bog-onion.

1. *Ornithology:*

(1) *Struthio camelus,* from the deserts of Africa and Arabia. It is the largest of all living birds, standing from six to eight feet in height, and has been known from remote antiquity [2]; Xenophon mentions it in the Anabasis (i. 5), as occurring in the plains of Artemisia, and there are frequent references to it in later Roman literature. Heliogabalus is said to have had a dish served up composed of the brains of six hundred ostriches (*Æl. Lampridius*). Hunters report that the flesh is palatable, though Browne (*Miscellanies*) remarks, doubtfully, "perhaps boiled and well cooked, after the art of Apicius, with peppermint, dates, and other good things, young ostriches might go down with some stomachs." The ostrich is hunted and bred for the sake of the quill feathers of the wings and tail, now used only by ladies, though formerly ostrich plumes decked the helmets of knights, still later, the hats of the Cavaliers, and the fashion came in again for a time at the Restoration. The ostrich is a vegetable feeder, but swallows stones, bits of iron, and other hard substances to aid the gizzard in its functions. On ostrich farms newly-hatched birds have been observed to pick up little stones before taking any food. The head and neck are nearly naked, body black, quill feathers of wings and tail white. The wings are useless for flight, but of so much assistance in running that the bird can outstrip the fleetest horse.

OSTRICH.

Ostriches are polygamous, the hens lay their eggs in a common nest—a hole scratched in the sand, and the cock-bird relieves the hens in the task of incubation, which is aided by the heat of the sun. [STRUTHIO.]

(2) The name Ostrich is often given loosely to individuals of the genera Rhea (q.v.) and Dromaius (q.v.).

Next a cell wall appears around the germinal vesicle, but separated from it by a certain interval, within which is a liquid containing globules of sarcode, the mass developing into the yolk. Then the vitelline membrane appears outside the yolk. There being little yolk in the human ovum, it is of smaller size than those of the inferior animals. It is a spherical body, about $\frac{1}{175}$ of an inch in diameter. It was first discovered by Von Baer in 1827. The germinal vesicle is $\frac{1}{1250}$, and the germinal spot $\frac{1}{3500}$ of an inch in diameter.

1. *Ornith.:* A popular English name for any nocturnal raptorial bird, of which about 200 species are known. Their classification is in a very unsettled state. Willnghby's division into two sections—one having "ears" or "horns," as the tufts of feathers on their heads were called, the other destitnte of such appendages—was shown to be unnatural by Geoffroy St. Hilaire. They were formerly made a family of Accipitres, or Raptores, but are now more generally raised to an order (or at least a sub-order), Striges. Following Alphonse Milne-Edwards, a classification has been proposed, based on pterylological and osteological characters, broadly dividing the Owls into two sections: (1) The Screech-owl, and (2) the Tawny-owl section, with (the Linnæan) *Strix flammea* and *S. stridula* as the respective types. The former is known as the Alucine (from Fleming's name for the genus, Aluco), and the latter as the Strigine section. The prevailing colour of the plumage is brown, with a tinge of rusty-red, and it is exceedingly loose and soft, so that their flight (even in the larger species) is almost noiseless, enabling them to swoop upon their prey, which they hunt in the twilight. All owls cast up in the form of pellets the indigestible parts of the food swallowed. These castings may be seen under any owl-roost, and show plainly the great service these birds render to man in destroying rats and mice. They range over the whole globe, extending to the extreme polar regions and to the remotest oceanic islands.

1. *Zoology:*

(1) The castrated male of *Bos taurus* when arrived at maturity. [BULL, STEER.]

(2) The popular English name for the genus Bos (q.v.). It has been known from remote antiquity, and in the East possessed, and in India still possesses, a sacred character. They have been broadly divided into two groups —the humped, with *Bos indicus,* and the straight-backed, with *B. taurus* as a type. The modern domestic oxen consist of a great number of different breeds, the principal of which are described under their respective names. The ox is not native to the New World, though largely introduced. Its progenitors were probably: (1) *Bos primigenius* [URUS]; (2) *B. longifrons,* "probably domesticated by the aborigines of Britain before the Roman invasion" (*Owen: Brit. Foss. Mammals,* p. 514); and (3) *B. frontosus,* which Nilsson regards as the progenitor of the mountain cattle of Norway. The English breeds may be conveniently grouped in three classes: (1) Polled cattle; (2) Short-horned cattle; and (3) Long-horned cattle, usually white and red and occupying the more fertile parts of the country. The Hungarian oxen are noted for their great size and enormous horns. The Friesland cattle were introduced into Spain, and so became the progenitors of the herds of wild cattle which roam over the South American continent, the desceudants, it is said, of seven cows and one bull brought from Andalusia to Paraguay in 1556. Oxen have been introduced into the United States, where they are raised in vast numbers; also into Australia and New Zealand. The Caffres train them to watch the flocks, to guard them against attacks of wild animals, and even to take part in intertribal battles. The peculiar home of hnmped oxen is India, where they appear to have been domesticated at an early period, as similar forms occur on sculptures of remote antiquity. They are also found in Japan and in Africa. [ZEBU, BRAHMAN-BULL.]

"It is impossible to overestimate the services rendered by the *ox* to the human race. Living, it ploughs its owner's land and reaps his harvest, carries his goods or himself, guards his property, and even fights his battles, while its udders, which under domestication have been enormously enlarged, yield him at all seasons a copious supply of milk. When dead, its flesh forms a chief source of animal food; its bones are ground into manure, or turned into numerous articles of use or ornament; its skin is made into leather, its ears and hoofs into glue; its hair is mixed with mortar; and its horns are cut and moulded into spoons and other useful articles."—*J. Gibson:* in *Encyc. Brit.* (ed. 9th), iii. 246.

Chem.: Symbol, O; at. wt. 16. A dyad element existing in the free state in the atmosphere, and in combination in the ocean. It forms about one-fifth of the former and eight-ninths of the latter. It is also present in the great majority of substances forming the earth's crust, and is the most abundant of all the elements. It was discovered in 1774 by Scheele in Sweden and Priestley in England

independently, but the name was given by Lavoisier some time after. It can be obtained pure by heating black oxide of manganese, or a mixture of this oxide with potassic chlorate in a retort, and collecting the gas over water. When pure it is without colour, taste, or smell. It is the sustaining principle of animal life and of the ordinary phenomena of combustion. Phosphorus and ignited charcoal burn in it with great brilliancy, and a piece of watch-spring, having at the end some lighted sulphur, exhibits in oxygen a beautiful phenomenon of combustion. It is a little heavier than atmospheric air, sp. gr. = 1·1. One hundred cubic inches of oxygen at mean temperature and pressure weigh 34·29 grains. Under the influence of cold and high pressure it has been reduced to the liquid state. It enters into combination in various ways, taking the place of hydrogen in the radicals of compounds formed on any of the types, HCl, H_2O, H_3N, &c., giving rise to oxychlorides, oxyiodides, oxynitrides, &c.

1. *Zool.:* The genus Ostrea (q.v.), and especially *Ostrea virginica*, the common American oyster, and *O. edulis*, the edible European species. There are several other edible species, but these are the best known and most esteemed. The American oysters are often very large, and whether large or small are considered by epicures on this side of the Atlantic to be much superior in flavor to the European species, which have a peculiar taste not agreeable to the American palate. They are raised in vast numbers both in native and in transplanted beds along the coast, and are sent to many parts of the country. The most prolific beds are those of Chesapeake Bay and Long Island Sound, while in the Southern States they grow in such multitudes as to form bars off the coast and to narrow the channels of certain rivers. Oysters vary in length from 3 to 6 inches, but sometimes grow considerably larger. In the European oyster beds the supply is principally obtained from cultivated deposits, the cultivated oysters being called Natives, and being much more highly esteemed than the Sea Oysters, or those of wild growth.

Oysters have been a favorite article of human food for an unknown period, the kitchen-middens of the United States and Europe being large collections of oyster and other shells, indicative of epicurean feasts at a remote antiquity. The Romans esteemed them highly, and practiced artificial culture in ponds, some of which are still used for this purpose. Within late years efforts have been made to raise oysters from the eggs artificially fertilized and planted in enclosed ponds. The experiments

have been successful, but no commercial application of them has been made. The oyster is exceedingly prolific, each female being said to produce millions of eggs. The young oysters are minute, swimming forms, very different in formation from the mature animal. After a short period of free life their shells develop, and they settle on stones, shells, or other material, where they spend the remainder of their lives in eating and growing, their food being microscopic plants and animals.

The bill, about three inches long, is a rich ruddy colour, deepest at the base; very much compressed, with a wedge-like termination. Oyster-catcher is a misnomer, for the bird feeds mostly on mussels and limpets, though it frequently takes to the water in search of food. Sometimes called the Sea Pie. Mr. Harting informed Prof. Newton that "the bird seems to lay its head sideways on the ground, and then, grasping the limpet's shell close to the rock between the mandibles, use them as scissor-blades to cut off the mollusc from its sticking-place." P.

P, The sixteenth letter and the twelfth consonant of the English alphabet is a labial sound, formed by a compression of the anterior part of the lips, as in *pull, papa, ap.* As a sharp labial it is classed with *f*, and corresponds to the flat labial *b*. *P* has but one sound in English, except when in combination with *h* it forms the digraph *ph*, which is sounded as *f*, and occurs in words derived from the Greek. In the case of many words derived from the Greek, initial *p* is not sounded, as in *pneumatics, psalm, psalter, pterodactyl.* It is sometimes, but rarely, silent in the middle of a word, as in *receipt. P* represents an original *b* in *gossip* (Mid. Eng. *godsib*), *purse* (O. Fr. *borse*, Lat. *bursa*), *apricot* (Fr. *abricot*). An original *p* is represented by *b* in *lobster* (Mid.
